

# WIP AT Commands User Guide

**WIPsoft 5.42**

**SIERRA**  
WIRELESS

WM\_DEV\_OAT\_UGD\_076  
010  
August 3, 2011

## Important Notice

Due to the nature of wireless communications, transmission and reception of data can never be guaranteed. Data may be delayed, corrupted (i.e., have errors) or be totally lost. Although significant delays or losses of data are rare when wireless devices such as the Sierra Wireless modem are used in a normal manner with a well-constructed network, the Sierra Wireless modem should not be used in situations where failure to transmit or receive data could result in damage of any kind to the user or any other party, including but not limited to personal injury, death, or loss of property. Sierra Wireless accepts no responsibility for damages of any kind resulting from delays or errors in data transmitted or received using the Sierra Wireless modem, or for failure of the Sierra Wireless modem to transmit or receive such data.

## Safety and Hazards

Do not operate the Sierra Wireless modem in areas where blasting is in progress, where explosive atmospheres may be present, near medical equipment, near life support equipment, or any equipment which may be susceptible to any form of radio interference. In such areas, the Sierra Wireless modem **MUST BE POWERED OFF**. The Sierra Wireless modem can transmit signals that could interfere with this equipment. Do not operate the Sierra Wireless modem in any aircraft, whether the aircraft is on the ground or in flight. In aircraft, the Sierra Wireless modem **MUST BE POWERED OFF**. When operating, the Sierra Wireless modem can transmit signals that could interfere with various onboard systems.

---

*Note: Some airlines may permit the use of cellular phones while the aircraft is on the ground and the door is open. Sierra Wireless modems may be used at this time.*

---

The driver or operator of any vehicle should not operate the Sierra Wireless modem while in control of a vehicle. Doing so will detract from the driver or operator's control and operation of that vehicle. In some states and provinces, operating such communications devices while in control of a vehicle is an offence.

## Limitations of Liability

This manual is provided "as is". Sierra Wireless makes no warranties of any kind, either expressed or implied, including any implied warranties of merchantability, fitness for a particular purpose, or noninfringement. The recipient of the manual shall endorse all risks arising from its use.

The information in this manual is subject to change without notice and does not represent a commitment on the part of Sierra Wireless. SIERRA WIRELESS AND ITS AFFILIATES SPECIFICALLY DISCLAIM LIABILITY FOR ANY AND ALL DIRECT, INDIRECT, SPECIAL, GENERAL, INCIDENTAL, CONSEQUENTIAL, PUNITIVE OR EXEMPLARY DAMAGES INCLUDING, BUT NOT LIMITED TO, LOSS OF PROFITS OR REVENUE OR ANTICIPATED PROFITS OR REVENUE ARISING OUT OF THE USE OR INABILITY TO USE ANY SIERRA WIRELESS PRODUCT, EVEN IF SIERRA WIRELESS AND/OR ITS AFFILIATES HAS BEEN ADVISED OF THE POSSIBILITY OF SUCH DAMAGES OR THEY ARE FORESEEABLE OR FOR CLAIMS BY ANY THIRD PARTY.

Notwithstanding the foregoing, in no event shall Sierra Wireless and/or its affiliates aggregate liability arising under or in connection with the Sierra Wireless product, regardless of the number of events, occurrences, or claims giving rise to liability, be in excess of the price paid by the purchaser for the Sierra Wireless product.

## Patents

This product may contain technology developed by or for Sierra Wireless Inc.

This product includes technology licensed from QUALCOMM® 3G.

This product is manufactured or sold by Sierra Wireless Inc. or its affiliates under one or more patents licensed from InterDigital Group.

## Copyright

# Document History

Version	Date	Updates
001	March 14 2008	Creation
002	May 30 2008	Update for WIPsoft v5.01
003	December 15, 2008	Update for WIPsoft v5.11
004	March 9, 2009	Update for WIPsoft v5.12
005	July 28, 2009	<p>Updated definition of Error <a href="#">850</a> and <a href="#">852</a> definitions updated.</p> <p>Added <a href="#">Note: If the Ethernet bearer support is defined, the Ethernet driver is subscribed on executing (+WIPCFG = 1).</a></p> <p><a href="#">AT_WIP_NET_OPT_AUTO_SWITCH</a> definition updated.</p> <p>&lt;bid&gt; parameter identifier updated to <a href="#">ETHER</a>.</p> <p>Seven new rows added to Parameters table starting with Parameter number <a href="#">23</a> through &lt;netmask IP @*&gt;.</p> <p>Caution regarding <a href="#">WIP_BOPT_IP_NETMASK</a> and <a href="#">WIP_BOPT_IP_GW</a> added.</p> <p>Example updated starting at <a href="#">AT+WIPBR=1,4</a> through the end of the table.</p> <p>Note that <a href="#">The Ethernet bearer can be started only in client mode</a> added.</p> <p>Definition updated and note added to discuss that <a href="#">data can be transferred using two modes</a>.</p> <p>Mode <a href="#">5</a> added and <a href="#">AT+WIPFILE=4,1,5,"report.log"</a> example enhanced to reflect new mode.</p> <p>New <a href="#">+WIPDATA</a> error added.</p>
006	February 22, 2010	Added opt num parameters <a href="#">WIP_BOPT_DEBUG_PKT</a> and <a href="#">WIP_BOPT_RESTART</a> to the <a href="#">+WIPBR</a> command.
007	March 24, 2010	Updated version number
008	July 20, 2010	Clarified the definition of the <a href="#">WIP_BOPT_PPP_CHAP</a> option for the <a href="#">+WIPBR</a> command.

Version	Date	Updates
009	February 18, 2011	<p>Corrected erroneous <a href="#">syntax</a> for mode=1 in the <a href="#">Service Creation +WIPCREATE</a> section.</p> <p>Added a new <a href="#">&lt;opt num&gt; 28</a> and its corresponding <a href="#">GPRS CME Errors</a> to the <a href="#">Bearers Handling +WIPBR</a> section.</p> <p>Added new DATA Offline function including:</p> <ul style="list-style-type: none"> <li>• New <a href="#">DATA Offline session +WIPDATARW</a> section.</li> <li>• New <a href="#">&lt;opt num&gt; 15</a> in the <a href="#">IP Stack Handling +WIPCFG</a> section.</li> <li>• New <a href="#">&lt;mode&gt; 6, 7, 8, and 9</a> in the <a href="#">File Exchange +WIPFILE</a> section.</li> <li>• New <a href="#">&lt;mode&gt; 3</a> and <a href="#">&lt;error&gt; 836</a> in the <a href="#">Socket Data exchange +WIPDATA</a> section.</li> <li>• New <a href="#">&lt;error&gt; 853</a>.</li> <li>• New <a href="#">FTP DATA Offline</a> example.</li> </ul> <p>Added new MMS function including:</p> <ul style="list-style-type: none"> <li>• Added new MMS <a href="#">&lt;mode&gt; = 8</a> and details to the subsections of the following commands: <ul style="list-style-type: none"> <li>• <a href="#">Service Creation +WIPCREATE</a></li> <li>• <a href="#">Closing a Service +WIPCLOSE</a></li> <li>• <a href="#">Service Option Handling +WIPOPT</a>, including additional options that can be applied to MMS sessions</li> <li>• <a href="#">File Exchange +WIPFILE</a></li> </ul> </li> <li>• <a href="#">MMS Example</a></li> <li>• <a href="#">MMS Errors 890 through 897</a></li> <li>• Note regarding the <a href="#">WIP_MMS_DONE</a> option.</li> </ul> <p>Added new TCP Options function as <a href="#">&lt;opt num&gt; 16</a> and <a href="#">17</a> in the <a href="#">IP Stack Handling +WIPCFG</a> section.</p>
010	August 3, 2011	<p>Updated the <a href="#">&lt;protocol&gt;=8</a> information for the <a href="#">AT+WIPFILE</a> command.</p> <p>Updated the <a href="#">AT+WIPOPT=8,1,2,96</a> code and the two following lines in the <a href="#">MMS</a> example.</p> <p>Added error <a href="#">801</a> to the <a href="#">+WIPFILE</a> command.</p> <p>Added a Caution notice to the section called <a href="#">Options that can be applied to MMS sessions</a>.</p> <p>Updated the +WIPCREATE <a href="#">Read command AT+WIPCREATE?</a> and corresponding <a href="#">example</a>.</p> <p>Added note regarding <a href="#">Option 16</a> to the <a href="#">+WIPBR</a> command</p>

10.1.	General CME Error Codes .....	121
10.2.	GPRS CME Error Codes .....	123

# >> 1. Introduction

The aim of this document is to provide Sierra Wireless customers with a full description of the AT commands associated with the WIP feature.

## 1.1. Abbreviations

Abbreviation	Definition
APN	Access Point Name
ASCII	American Standard Code for Information Interchange
AT	ATtention
BCC	Blind Carbon Copy
CC	Carbon Copy
CHAP	Challenge Handshake Authentication Protocol
CHV	Card Holder Verification
CID	Context IDentifier
CMUX	Converter Multiplexer
CPU	Central Processing Unit
DNS	Domain Name System
GGSN	Gateway GPRS Support Node
GPRS	General Packet Radio Service
GSM	Global System for Mobile communication
HTTP	Hyper Text Transfer Protocol
IP	Internet Protocol
IPCP	Internet Protocol Control Protocol
M	Mandatory
MS	Mobile Station
N/A	Not Applicable
MSCHAP	MicroSoft Challenge Handshake Authentication
MSS	Maximum Segment Size
NU	Not Used
O	Optional
OS	Operating System
PAP	Password Authentication Protocol
PDP	Packet Data Protocol
PIN	Personal Identity Number
POP3	Post Office Protocol
PPP	Point-to-Point Protocol
SIM	Subscriber Information Module
SMTP	Simple Mail Transfer Protocol
TCP	Transmission Control Protocol
TOS	Type Of Service
TTL	Time To Live

Abbreviation	Definition
UART	Universal Asynchronous Receiver Transmitter
UDP	User Data Protocol
URL	Uniform Resource Locator
WIP	Wavecom Internet Protocol

## 1.2. Logos

Logo	Definition
	This picture indicates the +WIND indication from which the AT command is allowed. X values can be: 1, 3, 4, or 16.
	This picture indicates that a SIM card must be inserted to support the AT command.
	This picture indicates that an AT command is supported even if the SIM card is absent.
	This picture indicates that the PIN 1 /CHV 1 code must be entered to support the AT command.
	This picture indicates that an AT command is supported even if the PIN 1 /CHV 1 code is not entered.
	This picture indicates that the PIN 2 /CHV 2 code must be entered to support the AT command.
	This picture indicates that an AT command is supported even if the PIN 2/CHV 2 code is not entered.

## 1.3. AT Commands Presentation Rules

The AT commands to be presented in the document are as follows:

- A "Description" section as Heading 3 provides general information on the AT command (or response) behavior.
- A "Syntax" section as Heading 3 describes the command and response syntaxes and all parameters description.
- A "Parameters and Defined Values" section as Heading 3 describes all parameters and values.
- A "Parameter Storage" as Heading 3 presents the command used to store the parameter value and/or the command used to restore the parameter default value.
- An "Examples" section as Heading 3 presents the real use of the described command.
- A "Note" section as Heading 3 can also be included indicating some remarks about the command use.

Figures are provided where necessary.

## 2. AT Command Syntax

This section describes the AT command format and the default value for their parameters.

### 2.1. Command Line

Commands always start by the standard prefix "AT+WIP" and end with the <CR> character. Optional parameters are shown in brackets [ ].

Example:

```
AT+WIPcmd=<Param1>[,<Param2>]
```

<Param2> is optional. When the AT+WIPcmd is executed without <Param2> the default value of <param2> is used.

### 2.2. Information Responses and Result Codes

Responses start and end with <CR><LF>, except for the ATV0 DCE response format and the ATQ1 (result code suppression) commands.

- If command syntax is incorrect, the "ERROR" string is returned.
- If command syntax is correct but transmitted with wrong parameters, the "+CME ERROR: <Err>" or "+CMS ERROR: <SmsErr>" strings is returned with adequate error codes if CMEE was previously set to 1. By default, CMEE is set to 0, and the error message is only "ERROR".
- If the command line has been executed successfully, an "OK" string is returned.

In some cases, such as "AT+CPIN?" or (unsolicited) incoming events, the product does not return the "OK" string as a response.

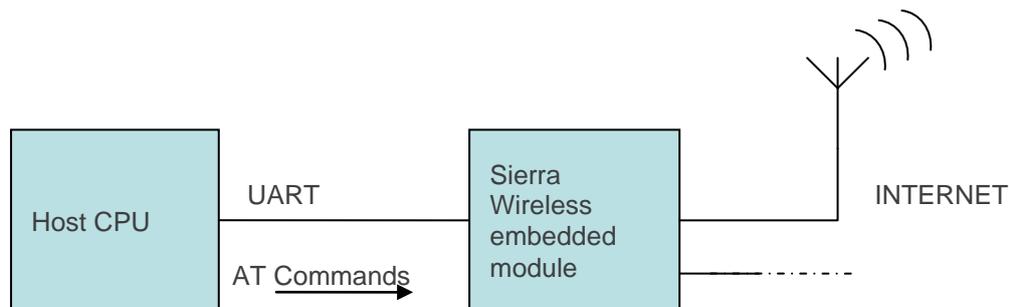

In the following examples <CR> and <CR><LF> are intentionally omitted.

## >> 3. Principles

WIPsoft is an application that implements the TCP/IP protocols using custom AT commands. This application operates in co-operative mode and must be downloaded to the Sierra Wireless embedded module. The commands are sent from an external application and the corresponding responses are sent back from the module to the external application. The WIPsoft uses the APIs provided by WIPlib and provides custom AT command interface to the external application.

AT+WIP commands involve:

- a host computer, which issues AT+WIP commands
- Sierra Wireless intelligent embedded module
- the rest of the Internet / Intranet

**Multiplexing:** Several sockets can be operating at once. The +WIPDATA command allows to temporarily identify the UART in data mode with a given socket. The data written on UART is transferred through the socket. The data which arrives on the socket can be read from the UART.

In AT mode, the host receives an unsolicited event when the data arrives on the socket.

**Multiple UARTs:** There can be several UARTs simultaneously active at once, and different UARTs can map a different socket simultaneously. However, it is forbidden to map a single socket on several UARTs simultaneously.

## 3.1. Sockets Identification

Sockets are identified by a pair of numbers: the first one identifies the protocol; the second one identifies a given socket of this protocol.

### 3.1.1. Possible Protocols

The possible protocols are,

- 1 = UDP
- 2 = TCP in connect mode (Client)
- 3 = TCP in listen mode (Server)
- 4 = FTP
- 5 = HTTP
- 6 = SMTP
- 7 = POP3
- 8 = MMS

Two pairs with a different protocol number but the same index identify two distinct sockets.

Example: Both 1,7 and 2,7 are valid identifiers simultaneously; the former identifies a UDP socket and the later, a TCP connected socket.

### 3.1.2. Number of Sockets

The number of sockets per protocol is limited.

- UDP : 8 sockets
- TCP Clients : 8 sockets
- TCP Servers : 4 sockets

### 3.1.3. Notes

The creation of basic sockets (TCP/UDP) is not commercial but other features are locked by a commercial feature named "internet plug-in". The WIPsoft commands used for socket/session creation will return a "+CME ERROR: 839" error code if the feature is not enabled. To enable the features, you can refer to the Firmware AT Commands Interface Manual (especially the AT+WCFM command) and we recommend you to contact your Sierra Wireless distributor or sales point for further details.

## >> 4. General Configuration

### 4.1. IP Stack Handling +WIPCFG

#### 4.1.1. Description

The +WIPCFG command is used for performing the following operations:

- start TCP/IP stack
- stop TCP/IP stack
- configuring TCP/IP stack
- displaying version information

#### 4.1.2. Syntax

- if <mode>=0,1

*Action Command*

**AT+WIPCFG=<mode>**

OK

- if <mode>=2

*Action Command*

**AT+WIPCFG=<mode>,<opt num>,<value>**

OK

- if <mode>=3

*Action Command*

**AT+WIPCFG=<mode>**

WIPsoft vXX.YY.ZZ on Open AT OS vA.B

MMM-DDD-YYYY HH:MM:SS <WIPLib: version number> <WIPsoft: version number>

OK

- if <mode>=4

*Action Command***AT+WIPCFG=<mode>,<action>**

OK

*Read Command***AT+WIPCFG?**

+WIPCFG: &lt;optnum&gt;,&lt;value&gt;

[+WIPCFG: &lt;optnum&gt;,&lt;value&gt;[...]]

OK

*Test Command***AT+WIPCFG=?**

OK

### 4.1.3. Parameters and Defined Values

<b>&lt;mode&gt;:</b>	requested operation
0	stop TCP/IP stack
1	start TCP/IP stack Note: If the Ethernet bearer support is defined, the Ethernet driver is subscribed on executing (+WIPCFG = 1)
2	configure TCP/IP stack
3	display TCP/IP application version
4	TCP/IP stack configuration management
<b>&lt;opt num&gt;:</b>	configuration option identifier
0	<p>WIP_NET_OPT_IP_TTL – Default TTL of outgoing data grams</p> <p>This option is a limit on the period of time or number of iterations or transmissions that a unit of data can experience before it should be discarded. The time to live (TTL) is an 8-bit field in the Internet Protocol (IP) header. It is the 9th octet of 20. The default value of this parameter is 64. Its value can be considered as an upper bound on the time that an IP datagram can exist in an internet system. The TTL field is set by the sender of the datagram, and reduced by every host on the route to its destination. If the TTL field reaches zero before the datagram arrives at its destination, then the datagram is discarded. This is used to avoid a situation in which an undelivered datagram keeps circulating in the network.</p> <p>range: 0-255 (default value: 64)</p>
1	<p>WIP_NET_OPT_IP_TOS – Default TOS of outgoing parameters</p> <p>The IP protocol provides a facility for the Internet layer to know about the various tradeoffs that should be made for a particular packet. This is required because paths through the Internet vary widely in terms of the quality of service provided. This facility is defined as the "Type of Service" facility, abbreviated as the "TOS facility".</p> <p>The TOS facility is one of the features of the Type of Service octet in the IP datagram header. The Type of Service octet consists of following three fields:</p> <pre> 0  1  2  3  4  5  6  7 +---+---+---+---+---+---+---+---+   PRECEDENCE             TOS     MBZ   +---+---+---+---+---+---+---+---+                 </pre> <p>The first field is "PRECEDENCE". It is intended to denote the importance or priority of the datagram.</p> <p>The second field is "TOS" which denotes how the network should maintain the tradeoffs between throughput, delay, reliability, and cost.</p> <p>The last field is "MBZ" (Must Be Zero), is currently unused and is set to 0. The TOS field can have the following values:</p> <p>1000 -- minimize delay 0100 -- maximize throughput</p>

	<p>0010 -- maximize reliability</p> <p>0001 -- minimize monetary cost</p> <p>0000 -- normal service</p> <p>For more information on this field please refer to RFC1349.</p> <p>range: 0-255 (default value: 0)</p>
2	<p>WIP_NET_OPT_IP_FRAG_TIMEO - Time to live in seconds of incomplete fragments</p> <p>When a datagram's size is larger than the MTU (Maximum Transmission Unit) of the network, then the datagram is divided into smaller fragments. These divided fragments are sent separately. The "WIP_NET_OPT_IP_FRAG_TIMEO" option specifies the Time to live for these fragments.</p> <p>range: 1-65535 (default value: 60)</p>
3	<p>WIP_NET_OPT_TCP_MAXINITWIN – Number of segments of initial TCP window</p> <p>This option is used to specify the number of segments in the initial TCP window.</p> <p>A TCP window specifies the amount of outstanding (unacknowledged by the recipient) data a sender can send on a particular connection before it gets an acknowledgment back from the receiver. The primary reason for the window is congestion control.</p> <p>range: 0-65535 (default value: 0)</p>
4	<p>WIP_NET_OPT_TCP_MIN_MSS - Default MSS of off-link connections</p> <p>This option is used by the WIPlib Plug-In internally. This parameter specifies the maximum size of TCP segment which would be sent. By default, the value of this parameter is set to 536. Hence WIPlib Plug-In would not send any TCP segment having a length greater than 536 bytes without header.</p> <p>range: 536-1460 (default value: 536)</p>
5	<p>WIP_NET_OPT_DEBUG_PORT</p> <p>This option is used to specify the port on which the debug traces are to be sent.</p> <p>range: 0-3 (default value: 0)</p>
12	<p>AT_WIP_NET_OPT_PREF_TIMEOUT_VALUE - Used for TCP sockets to configure the packet segmentation on IP network side</p> <p>This option is used to specify the maximum time to wait between two successive data chunks received from the mapped UART/serial port (please see +WIPDATA AT command). It allows the application to buffer a certain amount of data before writing on IP network side.</p> <p>Each unit in the range represents 100 msec. For example, value 10 for this option will give a wait time of 1sec (10*100msec).</p> <p>Default value for AT_WIP_NET_OPT_PREF_TIMEOUT_VALUE option is 0. This value means that no specific process is done to avoid TCP packets segmentation: data are written onto IP network without any delay after the reception of data from the mapped UART/serial port (please see +WIPDATA AT command). In this case some TCP packets sent on the IP network may be smaller than TCP_MIN_MSS value.</p> <p>Setting e.g. a 10 value for this option will make the application to wait at least 1 second or twice the TCP_MIN_MSS value to be reached before sending data on IP network. In this case, TCP packets size sent on the IP network should be equal to at least TCP_MIN_MSS (Default value = 536 bytes).</p> <p>range: 0- 100 (default value: 0)</p>
13	<p>AT_WIP_NET_OPT_ESC_SEQ_NOT_SENT : Used to configure whether a "+++" escape sequence should be sent as data to the peer. By default, this option is set to 0 which means that the "+++"sequence is sent to the peer as data. If set to 1, "+++"sequence is not sent as data to the peer.</p> <p>range: 0 -1(default value:0)</p>

	14	AT_WIP_NET_OPT_AUTO_SWITCH - Used for TCP socket, to switch back automatically to AT command mode when the TCP connection is closed by peer entity 0: Does not switch automatically to AT mode 1: Switches automatically to AT mode range: 0-1 (default value:0)
	15	Set DATA offline (+WIPDATARW) RX and TX buffer size in bytes range : 1 – 32000 (default value 2048)
	16	WIP_NET_OPT_TCP_REXMT_MAX – Maximum timeout of TCP packets; the maximum time between TCP retransmissions range: 1 - 64 (default value:64 seconds)
	17	WIP_NET_OPT_TCP_REXMT_MAXCNT - Max number of TCP packet retransmissions range: 1 - 12 (default value:12)
<b>&lt;action&gt;:</b>		requested operation on TCP/IP stack parameter management
	0	configuration storage (when existing) is freed
	1	stores the configuration parameters
<b>&lt;value&gt;:</b>		value range for different configuration options
<b>&lt;XX.YY.ZZ &gt;:</b>		WIPsoft release version
<b>&lt;A.B&gt;:</b>		Open AT <sup>®</sup> OS release version
<b>&lt;MM-DD-YYYY&gt;:</b>		date of built of WIPsoft application
<b>&lt;HH:MM:SS&gt;:</b>		time of built of WIPsoft application
<b>&lt;WIPlib: version number&gt;:</b>		WIPlib version
<b>&lt;WIPsoft: version number&gt;:</b>		internally identifying WIPsoft version

---

*Note: (WIP\_NET\_OPT\_SOCKET\_MAX + 1) sockets are reserved when UDP sockets are created (and not for TCP sockets); one socket buffer is added to support/afford DNS accesses*

*Note: For <opt num> numbers 6 through 11, the AT+WIPS command must be issued. For complete details regarding AT+WIPS, please refer the Firmware AT Commands Interface Manual.*

---

## 4.1.4. Parameter Storage

Only one IP stack configuration set can be saved into the FLASH memory.

- “AT+WIPCFG=4,1” is used to store the TCP/IP stack configuration parameters into the FLASH memory
- “AT+WIPCFG=4,0” is used to free the TCP/IP stack configuration storage

Executing “AT+WIPCFG=1” will apply default parameters when existing. Still it is possible to change option values at run time using “AT+WIPCFG=2,<optnum>,<optvalue>”.

## 4.1.5. Possible Errors

The possible error message is displayed only if “AT+CMEE=1” is activated else “ERROR” is displayed.

“+CMEE” AT error code	Description
800	invalid option
801	invalid option value
802	not enough memory left
820	error writing configuration in FLASH memory
821	error freeing configuration in FLASH memory
844	stack already started
850	initialization failed
852	IP stack not initialized

### 4.1.6. Examples

Command	Responses
<b>AT+WIPCFG=1</b> <i>Note: Start IP Stack</i>	OK
<b>AT+WIPCFG?</b>	+WIPCFG: 0,64 +WIPCFG: 1,0 +WIPCFG: 2,60 +WIPCFG: 3,0 +WIPCFG: 4,536 +WIPCFG: 5,0 +WIPCFG: 6,8 +WIPCFG: 7,32 +WIPCFG: 8,0 +WIPCFG: 9,0 +WIPCFG: 10,4 +WIPCFG: 11,4 +WIPCFG: 12,10 +WIPCFG: 13,0 +WIPCFG: 14,0 +WIPCFG: 15,2048 +WIPCFG: 16,64 +WIPCFG: 17,12 OK
<b>AT+WIPCFG=2,0,10</b> <i>Note: Configure TTL of IP Stack</i>	OK
<b>AT+WIPCFG?</b>	+WIPCFG: 0,10 +WIPCFG: 1,0 +WIPCFG: 2,60 +WIPCFG: 3,0 +WIPCFG: 4,536 +WIPCFG: 5,0 +WIPCFG: 6,8 +WIPCFG: 7,32 +WIPCFG: 8,0 +WIPCFG: 9,0 +WIPCFG: 10,4 +WIPCFG: 11,4 +WIPCFG: 12,10 +WIPCFG: 13,0 +WIPCFG: 14,0 +WIPCFG: 15,2048 +WIPCFG: 16,64 +WIPCFG: 17,12 OK

Command	Responses
<b>AT+WIPCFG=3</b>	WIPsoft v202 on Open AT OS v312 Mar 26 2007 11:45:46 WIPLib:v2a07 WIPsoft:v1a12
<i>Note: Display software version</i>	OK
<b>AT+WIPCFG=0</b> <i>Note: Stop the TCP/IP Stack</i>	OK
<b>AT+WIPCFG=4, 1</b> <i>Note: Store IP configuration parameters into FLASH</i>	OK
<b>AT+WIPCFG=4, 0</b> <i>Note: Free IP configuration parameters stored in FLASH</i>	OK

## 4.1.7. Notes

It is recommended to change the default settings of the WIP stack using +WIPCFG only when it is required. Changing the parameter values especially the max number of sockets and the max TCP buffer size with the high values lead to over consumption of the stack memory which causes the WIPsoft to crash. Hence, care must be taken when the default settings of the stack is changed using +WIPCFG command.

Following option values set by +WIPCFG command are taken into consideration at the run time. The below option values except for AT\_WIP\_NET\_OPT\_PREF\_TIMEOUT\_VALUE and AT\_WIP\_NET\_OPT\_ESC\_SEQ\_NOT\_SENT will be taken into consideration at next start up only if these are saved in the flash before stopping the stack.

- WIP\_NET\_OPT\_IP\_TTL
- WIP\_NET\_OPT\_IP\_TOS
- WIP\_NET\_OPT\_IP\_FRAG\_TIMEO
- WIP\_NET\_OPT\_TCP\_MAXINITWIN
- WIP\_NET\_OPT\_TCP\_MIN\_MSS
- WIP\_NET\_OPT\_DEBUG\_PORT
- AT\_WIP\_NET\_OPT\_PREF\_TIMEOUT\_VALUE
- AT\_WIP\_NET\_OPT\_ESC\_SEQ\_NOT\_SENT
- AT\_WIP\_NET\_OPT\_AUTO\_SWITCH

## 4.2. Bearers Handling +WIPBR

### 4.2.1. Description

The +WIPBR command can be used to

- select the bearer
- start/close the bearer
- configure different bearer options such as access point name

### 4.2.2. Syntax

- if <cmdtype>=0,1 or 5

*Action Command*

```
AT+WIPBR=<cmdtype>,<bid>
```

OK

- if <cmdtype>=2

*Action Command*

```
AT+WIPBR=<cmdtype>,<bid>,<opt num>,<value>
```

OK

- if <cmdtype>=3

*Action Command*

```
AT+WIPBR=<cmdtype>,<bid>,<opt num>
```

```
+WIPBR: <bid>,<opt num>,<value>
```

OK

- if <cmdtype>=4

*Action Command*

```
AT+WIPBR=<cmdtype>,<bid>,<mode>[,<login>,<password>,[<caller  
identity>]]
```

OK

- if <cmdtype>=6

*Action Command*  
**AT+WIPBR=<cmdtype>,<bid>,<mode>**  
 OK

*Read Command*  
**AT+WIPBR?**  
 <bid>,<state>  
 [<bid>,<state>[...]]  
 OK

*Test Command*  
**AT+WIPBR=?**  
 OK

- if <mode>=1

*Unsolicited response*  
 +WIPBR: <bid>,<status>,<local IP @>,<remote IP @>,<DNS1 @>,<DNS2 @>

### 4.2.3. Parameters and Defined Values

<b>&lt;cmd type&gt;:</b>		type of command
	0	close bearer
	1	open bearer
	2	set value of different bearer options
	3	get value of different bearer options
	4	start bearer
	5	stop bearer
	6	bearer configuration management
<b>&lt;bid&gt;:</b>		bearer Identifier
	1	UART1
	2	UART2

	3	N/A
	4	ETHER
	5	GSM
	6	GPRS
	11..14	CMUX port over UART1
	21..24	CMUX port over UART2
<b>&lt;opt num&gt;:</b>		bearer option identifier
	0	WIP_BOPT_LOGIN – username (string) max: 64 characters
	1	WIP_BOPT_PASSWORD – password (string) max: 64 characters
	2	WIP_BOPT_DIAL_PHONENB – phone number (string) max: 32 characters
	5	WIP_BOPT_DIAL_RINGCOUNT - Number of rings to wait before sending the WIP_BEV_DIAL_CALL event range: 0-65535
	6	WIP_BOPT_DIAL_MSNULLMODEM - Enable MS-Windows null-modem protocol ("CLIENT"/"SERVER" handshake) range: 0-1
	7	WIP_BOPT_PPP_PAP - Allow PAP authentication range: 0-1
	8	WIP_BOPT_PPP_CHAP - Allow CHAP authentication for the connection between the PC and the Wireless CPU (UART bearer) range: 0-1
	9	WIP_BOPT_PPP_MSCHAP1 - Allow MSCHAPv1 authentication range: 0-1
	10	WIP_BOPT_PPP_MSCHAP2 - Allow MSCHAPv2 authentication range: 0-1
	11	WIP_BOPT_GPRS_APN - Address of GGSN (string) max: 96 characters
	12	WIP_BOPT_GPRS_CID - Cid of the PDP context range: 1-4
	13	WIP_BOPT_GPRS_HEADERCOMP - Enable PDP header compression range: 0-1
	14	WIP_BOPT_GPRS_DATACOMP - Enable PDP data compression range: 0-1
	15	WIP_BOPT_IP_ADDR - Local IP address (IP/string)

16	WIP_BOPT_IP_DST_ADDR - Destination IP address (IP/string) <i>Note: This option is available only for UART PPP and GSM PPP, and is not applicable for GPRS bearer.</i>
17	WIP_BOPT_IP_DNS1 - Address of primary DNS server (IP/string)
18	WIP_BOPT_IP_DNS2 - Address of secondary DNS server (IP/string)
19	WIP_BOPT_IP_SETDNS - Configure DNS resolver when connection is established range: 0-1
20	WIP_BOPT_IP_SETGW - Set interface as default gateway when connection is established range: 0-1
21	WIP_BOPT_GPRS_TIMEOUT - Define a time limit to connect GPRS bearer. For example, value 300 for this option sets a wait time of 30s (300*100ms). Note: If timer expires before GPRS bearer connects, error 847 is returned. range: 300-1200 (default: 1200).
22	WIP_BOPT_DEBUG_PKT - Enable the debug traces of NET level 10 range: 0-1
23	WIP_BOPT_IP_DHCP - Enables auto-configuration of IP address and Netmask with DHCP range:0-1
24	WIP_BOPT_IP_MAC - Reads the MAC address, functioning as a read only option
25	WIP_BOPT_IP_NETMASK - Sets the Network mask
26	WIP_BOPT_IP_GW - Sets address of default gateway
27	WIP_BOPT_RESTART - Automatically restart server after connection is terminated
28	WIP_BOPT_GPRS_ERROR_REPORTING – report <a href="#">GPRS CME errors</a> instead of WIPsoft generic error range:0-1 (default=0 for WIPsoft generic error)
<b>&lt;mac IP @*&gt;:</b> MAC address of Ethernet driver	
<b>&lt;gateway IP @*&gt;:</b> default gateway address	
<b>&lt;netmask IP @*&gt;:</b> network mask address	
<b>&lt;value&gt;:</b> range of value for different bearer options	
<b>&lt;mode&gt;:</b> mode of operation	
0	client
1	server
<b>&lt;state&gt;:</b> current state of the bearer	
0	stopped

	1	started
<b>&lt;status&gt;:</b>		result of the connection process
	0	successful
	any other value	to be matched to error code value (e.g. "814" means PPP authentication failure )
<b>&lt;local IP @*&gt;:</b>		local IP address
<b>&lt;remote IP @*&gt;:</b>		remote IP address. (first node in internet)
<b>&lt;DNS1 IP @*&gt;:</b>		Domain Name Server address
<b>&lt;DNS2 IP @*&gt;:</b>		Domain Name Server address
<b>&lt;login&gt;:</b>		PPP login
<b>&lt;passwd&gt;:</b>		PPP password
<b>&lt;caller identity&gt;:</b>		optional ASCII string (type ascii*).  If not specified, then target will accept all DATA calls (independently of caller identification). If specified, then target will only accept calls from <caller identity>(which is the GSM data call number of the GSM client).

\* IP @ are displayed in alpha numeric dot format. e.g. 192.168.0.1...When no IP address is known, "0.0.0.0" is displayed.

---

**Caution:** The options WIP\_BOPT\_IP\_ADDR, WIP\_BOPT\_IP\_DST\_ADDR, WIP\_BOPT\_IP\_DNS1 and WIP\_BOPT\_IP\_DNS2 can be read after the bearer connection is established successfully. If an attempt is made to read the options value before the bearer connection is established successfully, incorrect IP address will be received.

**Caution:** The options WIP\_BOPT\_IP\_NETMASK and WIP\_BOPT\_IP\_GW can be read after the bearer connection is established successfully. If an attempt is made to read the options value before the bearer connection is established successfully, incorrect IP address will be received.

Also the option WIP\_BOPT\_IP\_MAC can be read after the bearer connection is open successfully. If an attempt is made to read the options value before the bearer connection is open, incorrect IP address will be received.

If the Ethernet bearer supported is defined, the MAC address is read from the Ethernet driver on opening the bearer(i.e., +WIPBR=4,1).

---

## 4.2.4. Parameter Storage

Several bearer configuration set can be saved.

Calling twice AT+WIPBR=6,<bid>,1 with the same <bid> will store the last configuration set.

- "AT+WIPBR=6,<bid>,1" is used to store the bearer configuration parameters set associated with the bearer <bid> into the FLASH memory.
- "AT+WIPBR=6,<bid>,0" is used to free the bearer configuration parameters set associated with the bearer <bid>.

Executing "AT+WIPBR=1,<bid>" will open bearer <bid> with default parameters of the bearer when existing.

## 4.2.5. Possible Errors

### 4.2.5.1. General CME Errors

The possible error message is displayed only if "AT+CMEE=1" is activated else "ERROR" is displayed.

"+CMEE" AT error code	Description
800	invalid option
801	invalid option value
802	not enough memory left
803	operation not allowed in the current WIP stack state
804	device already open
807	bearer connection failure : line busy
808	bearer connection failure : no answer
815	bearer connection failure : PPP authentication failed
816	bearer connection failure : PPP IPCP negotiation failed
820	error writing configuration in FLASH memory
821	error freeing configuration in FLASH memory
847	bearer connection failure: WIP_BOPT_GPRS_TIMEOUT time limit expired before GPRS bearer connected
848	impossible to connect to the bearer
849	connection to the bearer has succeeded but a problem has occurred during the data flow establishment

### 4.2.5.2. GPRS CME Errors

GPRS CME errors are listed in the table below.

Error code	Meaning	Resulting from the following commands
103	Incorrect MS identity.(#3)	+CGATT
132	service option not supported (#32)	+CGACT +CGDATA ATD*99
133	requested service option not subscribed (#33)	+CGACT +CGDATA ATD*99
134	service option temporarily out of order (#26, #34, #38)	+CGACT +CGDATA ATD*99
148	unspecified GPRS error	All GPRS commands
149	PDP authentication failure (#29)	+CGACT +CGDATA ATD*99
150	invalid mobile class	+CGCLASS +CGATT

## 4.2.6. Examples

Command	Responses
<b>AT+WIPBR?</b>	1,0 6,1 OK <i>Note: Bearer UART1 is open but not started bearer GPRS is open and started</i>
<b>AT+WIPBR?</b>	OK <i>Note: No bearer has been opened yet</i>
<b>AT+WIPBR=1,6</b> <i>Note: Open GPRS bearer</i>	OK
<b>AT+WIPBR=2,6,11,"APN name"</b> <i>Note: Set APN of GPRS bearer</i>	OK
<b>AT+WIPBR=3,6,11</b> <i>Note: Get APN of GPRS bearer</i>	+WIPBR: 6,11,"APN name" OK
<b>AT+WIPBR=2,6,21,600</b> <i>Note: set GPRS connection timeout value to 60s</i>	OK
<b>AT+WIPBR=4,6,0</b> <i>Note: Start GPRS bearer</i>	OK
<b>AT+WIPBR=5,6</b> <i>Note: Stop GPRS bearer</i>	OK
<b>AT+WIPBR=0,6</b> <i>Note: Close GPRS bearer</i>	OK
<b>AT+WIPBR=1,5</b> <i>Note: Open GSM bearer</i>	OK
<b>AT+WIPBR=2,5,0,"login"</b> <i>Note: Set the login for GSM bearer</i>	OK
<b>AT+WIPBR=2,5,1,"password"</b> <i>Note: Set the password for GSM bearer</i>	OK
<b>AT+WIPBR=2,5,2,"phonenumber"</b> <i>Note: Set the phone number for GSM bearer</i>	OK
<b>AT+WIPBR=2,5,15,"1.1.1.1"</b> <i>Note: Set the local IP address for GSM bearer</i>	OK
<b>AT+WIPBR=2,5,16,"2.2.2.2"</b> <i>Note: Set the destination IP address for GSM bearer</i>	OK

Command	Responses
<b>AT+WIPBR=3,5,15</b>	+WIPBR: 5,15,"0.0.0.0"
	OK
<i>Note: Read the local IP address for GSM bearer</i>	<i>Note: Local IP address is not set as GSM bearer is still not connected</i>
<b>AT+WIPBR=3,5,16</b>	+WIPBR: 5,16,"0.0.0.0"
	OK
<i>Note: Read the destination IP address for GSM bearer</i>	<i>Note: Destination IP address is not set as GSM bearer is still not connected</i>
<b>AT+WIPBR=4,5,0</b>	OK
<i>Note: Start the GSM bearer as a client</i>	
<b>AT+WIPBR=3,5,15</b>	+WIPBR: 5,15,"1.1.1.1"
<i>Note: Read the local IP for GSM bearer</i>	OK
<b>AT+WIPBR=3,5,16</b>	+WIPBR: 5,16,"2.2.2.2"
<i>Note: Read the destination IP for GSM bearer</i>	OK
<b>AT+WIPBR=5,5</b>	OK
<i>Note: Stop the GSM bearer</i>	
<b>AT+WIPBR=0,5</b>	OK
<i>Note: Close the GSM bearer</i>	
<b>AT+WIPBR=1,4</b>	OK
<i>Note: Opens the Ethernet bearer.</i>	
<b>AT+WIPBR=4,4,0</b>	OK
<i>Note: Starts the Ethernet bearer in client mode.</i>	
<b>AT+WIPBR=5,4</b>	OK
<i>Note: Stops the Ethernet bearer.</i>	
<b>AT+WIPBR=0,4</b>	OK
<i>Note: Closes the Ethernet bearer.</i>	
<b>AT+WIPBR=2,4,23,"1"</b>	OK
<i>Note: Sets the DHCP to TRUE. Default: TRUE.</i>	
<b>AT+WIPBR=3,4,24</b>	+WIPBR: 4,24,"1.1.1.1"
<i>Note: Reads the MAC address.</i>	OK
<b>AT+WIPBR =2,4,25," &lt;getway IP @*&gt;"</b>	OK
<i>Note: Sets the Default gateway address.</i>	
<b>AT+WIPBR=2,4,26," &lt;netmask IP @*&gt;"</b>	OK
<i>Note: Sets the Network mask address.</i>	

Command	Responses
<b>AT+WIPBR=3,4,23</b> <i>Note: Reads the DHCP value.</i>	+WIPBR: 4,23,1 OK
<b>AT+WIPBR=3,4,25</b> <i>Note: Reads the Default gateway address.</i>	+WIPBR: 4,25,"10.66.67.193" OK
<b>AT+WIPBR=3,4,26</b> <i>Note: Reads the Network mask address.</i>	+WIPBR: 4,26,"255.255.255.192" OK

## 4.2.7. Notes

### 4.2.7.1. For Starting a Bearer

The mandatory parameters to start a bearer in

- server mode: <cmdtype>, <bid>, <mode>, <login> and <password>
- client mode: <cmdtype>, <bid> and <mode>

Depending on the mode and the bearer type, additional parameters are required or forbidden:

Bid	Mode	Other Parameters
1,3,11,14,21,24	0	None
1,3,11,14,21,24	1	<PPP login>, <PPP password>
5	0	None
5	1	<login>,<password>[,<caller identity>]
6	0	None

Starting bearer as a server requires additional parameters as mentioned in the above table.

- For PPP server, only parameters <login> and <password> are required. They will be compared with remote PPP client login and password.
- For GSM server, <login> and <password> will be used for PPP over GSM establishment (same behavior as described for PPP server).

The <caller identity> is an optional ASCII string (type ASCII\*). If not specified, then target will accept all DATA calls (independently of caller identification). If specified, then target will only accept calls from <caller identity> (which is the GSM data call number of the GSM client).

Opening bearer only consists in associating the IP protocol stack with the specified bearer. The corresponding bearer setup has to be done through the adequate already existing AT commands (please refer to +WMFM commands for UART1 and UART2, +CMUX command for CMUX virtual ports and GSM/GPRS AT commands).

Several bearers can be opened at the same time but only one bearer can be started at a time.

If both DNS1 and DNS2 are displayed as "0.0.0.0" in the unsolicited message when bearer is opened in server mode, it means that connecting to a remote IP host through an URL will fail.

The options WIP\_BOPT\_DIAL\_REDIALCOUNT and WIP\_BOPT\_DIAL\_REDIALDELAY will not be implemented through AT commands. Nevertheless, for future compatibility reason, Opt num 3 and 4 are kept as reserved.

For GSM bearer, the options WIP\_BOPT\_IP\_ADDR and WIP\_BOPT\_IP\_DST\_ADDR will display valid addresses only when the bearer is started and connected, else it will display an address "0.0.0.0".

The Ethernet bearer can be started only in client mode.

## >> 5. IP Protocol Services

### 5.1. Service Creation +WIPCREATE

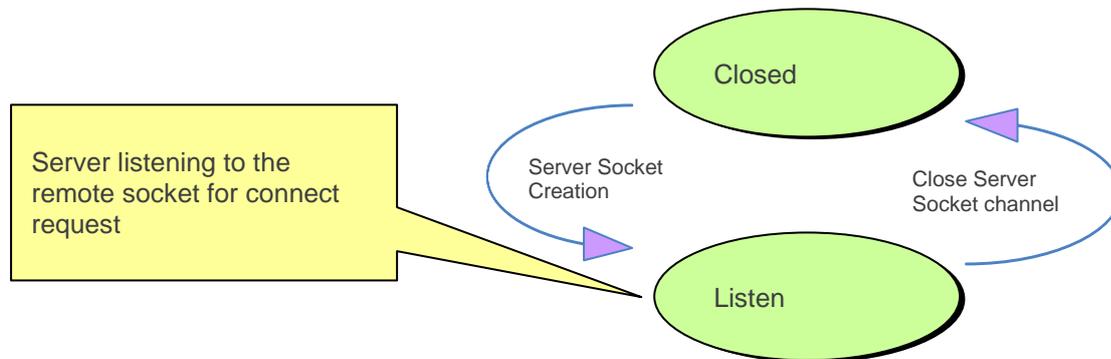

#### 5.1.1. Description

The +WIPCREATE command is used to create UDP, TCP client and TCP server sockets associated with the specified index and FTP/HTTP/SMTP/ POP3 service. Only one FTP/HTTP/SMTP/POP3/MMS session at a time is available.

If a local port is specified while creating a socket, the created socket will be assigned to this port; if not, a port will be assigned dynamically by WIP application. If peer IP and peer port is specified, the created socket will be connected to the specified IP and port.

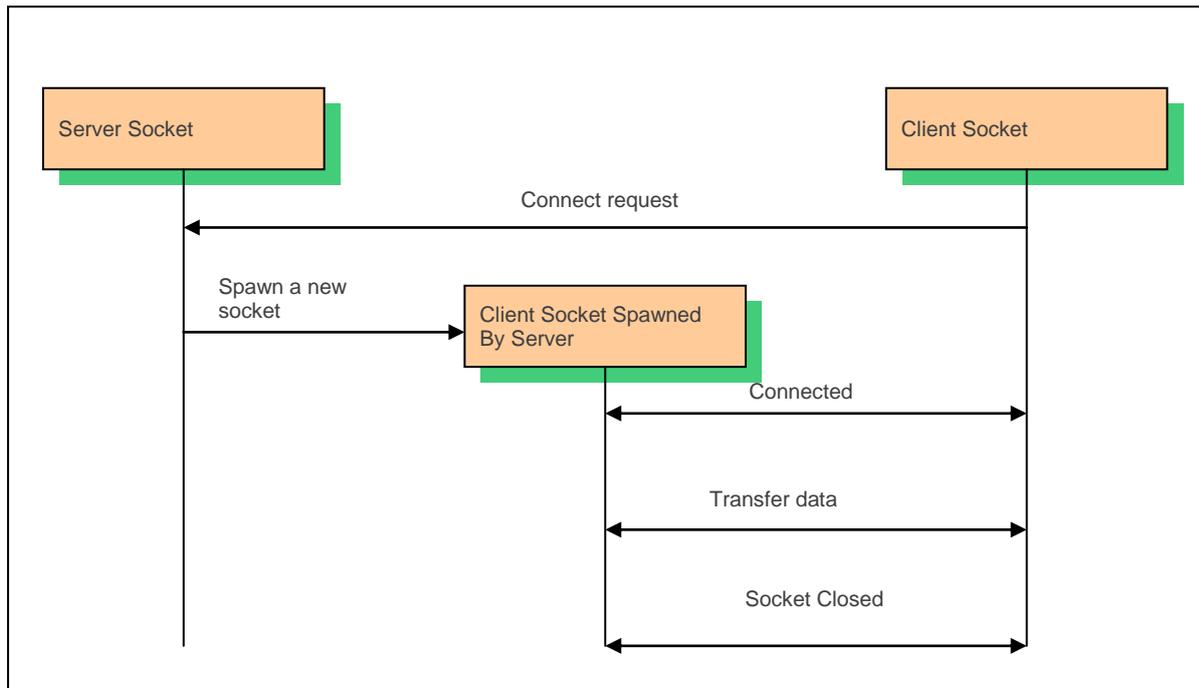

TCP server cannot be used to transfer data. To transfer data, it creates a local TCP client socket. This process of creating local socket is referred as “spawning”. When a server socket is created using, socket passively listens on a specified port for incoming connections. The below mentioned diagram shows different states managed for TCP server.

On reception of a connection request from a remote client socket, a server socket does the following,

- spawns a new socket (client) to connect to the remote socket
- data transfer is done between the spawned socket and the remote socket
- server socket remains in the listening mode and is ready to accept the request from other clients

Below mentioned diagram shows connection establishment procedure.

## 5.1.2. Syntax

- if <mode>=1

*Action Command*

```
AT+WIPCREATE=<mode>,<communication index>,<local port> [,<peer IP>,<peer port>]
```

OK

- if <mode>=2

*Action Command*

```
AT+WIPCREATE=<mode>,<communication index>,<peer IP>,<peer port>
```

OK

- if <mode>=3

*Action Command*

**AT+WIPCREATE=<mode>,<server index>,<local port>,<from idx>,<to idx>**

OK

- if <mode>=4

*Action Command*

**AT+WIPCREATE=<mode>,<index>,<server>[,<peer\_port>],<username>,<password>[,<account>]**

OK

- if <mode>=5

*Action Command*

**AT+WIPCREATE=<mode>,<index>,[<server>[,<peer port>]][, <username>,<password>][,<header list>[...]]**

OK

- if <mode>=6 or 7

*Action Command*

**AT+WIPCREATE=<mode>,<index>,<server>[,<peer port>][,<username>,<password>]**

OK

- if <mode>=8

*Action Command*

**AT+WIPCREATE=<mode>,<index>,<server>,<peer port>,<url>**

OK

*Read Command***AT+WIPCREATE?**

+WIPREADY: <mode>,<communication index>[, <peer IP>[, <user name>[, <password>]]]

(mode = 1, 2, 4, 5, 6, 7 or 8)

+WIPSERV: <mode>,<communication index>,<local port>,<from idx>,<to idx>

(mode = 1 and 3)

---

*Note:* Only sockets created with +WIPCREATE command are displayed.

*Test Command*  
**AT+WIPCREATE=?**  
 OK

- if <mode>=1 or 2

*Unsolicited response*  
 +WIPREADY: <mode>,<communication index>

### 5.1.3. Parameters and Defined Values

<b>&lt;mode&gt;:</b>	specifies type of socket
	1      UDP
	2      TCP Client
	3      TCP server
	4      FTP
	5      HTTP Client
	6      SMTP Client
	7      POP3 Client
	8      MMS Client
<b>&lt;index&gt;:</b>	TCP/UDP/FTP/HTTP/SMTP/POP3/MMS session identifier
<b>&lt;local port&gt;:</b>	local TCP/UDP port
<b>&lt;peer IP&gt;:</b>	peer IP address; a string between quotes indicating an address either in numeric form (e.g. "85.12.133.10") or as a DNS entry (e.g. "www.sierrawireless.com")

## 5.1.4. Parameter Storage

None

## 5.1.5. Possible Errors

"+CMEE" AT error code	Description
3	operation not allowed
800	invalid option
803	operation not allowed in the current WIP stack state
830	bad index
832	bad port number
834	not implemented
836	memory allocation error
837	bad protocol
839	error during channel creation
840	UDP/TCP socket or FTP/HTTP/SMTP/POP3 session is already active
842	destination host unreachable ( whether host unreachable, Network unreachable, response timeout)
845	attempt is made to reserve/create a client socket which is already reserved/opened by TCP server/client
851	incorrect number of parameters submitted
860	protocol undefined or internal error
861	user name rejected by server
862	password rejected by server
865	authentication error
866	server not ready error

## 5.1.6. Examples

Command	Responses
<b>AT+WIPCREATE=1,1,80</b>	OK
<i>Note: Create the UDP socket on local port 80 with communication index = 1 ⇔ embedded module acts as an UDP server awaiting for incoming datagram on local port 80</i>	<i>Note: An unsolicited event +WIPREADY: 1,1 will be received once the UDP socket is ready for usage</i>
<b>AT+WIPCREATE=1,1,"www.sierrawireless.com",80</b>	OK

Command	Responses
<i>Note: Create the UDP socket on arbitrary free local port with peer IP and peer port 80 with communication index = 1 ⇔ embedded module acts as a UDP client that can send datagram towards the remote entity</i>	<i>Note: An unsolicited event +WIPREADY: 1,1 will be received once the UDP socket is ready for usage</i>
<b>AT+WIPCREATE=1,1,80,"www.sierrawireless.com",80</b>	OK
<i>Note: Create the UDP socket on local port 80 with peer IP and peer port 80 with communication index = 1 ⇔ embedded module acts as a UDP client and an UDP server : it can send datagram towards the remote entity and receiving datagram on the specified local port.</i>	<i>Note: An unsolicited event +WIPREADY: 1,1 will be received once the UDP socket is ready for usage</i>
<b>AT+WIPCREATE=3,1,80,5,8</b>	OK
<i>Note: Create the TCP server on port 80 with server index=1 ⇔ embedded module acts as a TCP server : it will from now on spawn TCP client socket from communication index 5 to 8</i>	<i>Note: An unsolicited event +WIPACCEPT: 1,5 will be received once the TCP server is ready for usage</i>
<b>AT+WIPCREATE=2,1,"IP ADDR",80</b>	OK
<i>Note: Create the TCP client on port 80 with index=1 ⇔ embedded module acts as a TCP client : it can from now on communicate with the remote specified entity through communication index 1</i>	<i>Note: An unsolicited event +WIPREADY: 2,1 will be received once the TCP client is ready for usage</i>
<b>AT+WIPCREATE=4,1,"ftp.sierrawireless.com","admin","123456"</b>  <i>Note: Create a FTP session ⇔ towards the remote specified FTP server. Communication index to be used then is 1</i>	OK
<b>AT+WIPCREATE=5,1,"proxyaddress", ,"user name","password","User-Agent", "WIP-HTTP-Client/1.0"</b>	OK +WIPREADY: 5, 1
	<i>Note: HTTP session with proxy and 1 message header field</i>  <i>Use default 80 proxy port number</i>  <i>1 message header field:</i>  <i>Message header field name is "User-Agent"</i>  <i>Message header field value is "WIP-HTTP-Client/1.0"</i>
<b>AT+WIPCREATE=5,1,"proxyaddress", ,"user name","password","User-Agent", "WIP-HTTP-Client/1.0","Accept-Encoding", "gzip","Accept-Language", "en-US"</b>	OK +WIPREADY: 5, 1

Command	Responses
	<p><i>Note: HTTP session with proxy and 3 message header fields</i></p> <p><i>Use default 80 proxy port number</i></p> <p><i>3 message header fields:</i></p> <p><i>Message header field name is "User-Agent" and header field value is "WIP-HTTP-Client/1.0"</i></p> <p><i>Message header field name is "Accept-Encoding" and header field value is "gzip"</i></p> <p><i>Message header field name is "Accept-Language" and header field value is "en-US"</i></p>
<b>AT+WIPCREATE=5,1,"proxyaddress", ,"user","pass"</b>	<p>OK</p> <p>+WIPREADY: 5, 1</p>
	<i>Note: Authentication connection on default proxy server port 80</i>
<b>AT+WIPCREATE=6,1,"smtp.mail.yaho o.fr","587","user","pass"</b>	<p>OK</p> <p>+WIPREADY: 6, 1</p>
	<i>Note: Connect to SMTP server port 587 with given username and password</i>
<b>AT+WIPCREATE=7,1,"192.168.1.4", 110","user","pass"</b>	<p>OK</p> <p>+WIPREADY: 7, 1</p>
	<i>Note: Connect to POP3 server port 110 with given username and password</i>
<b>AT+WIPCREATE=7,1, "pop.mail.server.com"</b>	<p>OK</p> <p>+WIPREADY: 7, 1</p>
	<i>Note: Connect to the default port 110 of POP3 server, with no authentication required</i>
<b>AT+WIPCREATE=8,1, "192.168.10.200",8080,"http://mm s.orange.fr"</b>	<p>OK</p> <p>+WIPREADY: 8, 1</p>
	<i>Note: Connect to the MMS server, with no authentication required</i>
<b>AT+WIPCREATE?</b>	OK
	<i>Note: No active socket/protocol.</i>
<b>AT+WIPCREATE=3,1,80,3,4</b>	OK
	<i>Note: TCP server created.</i>
	+WIPACCEPT: 1, 3
	+WIPACCEPT: 1, 4
	<i>Note: Two external TCP clients connected.</i>

Command	Responses
<b>AT+WIPCREATE?</b>	+WIPREADY: 2,3,"192.168.0.2" +WIPREADY: 2,4,"192.168.10.20" +WIPSERV: 3,1,80,3,4 OK
	<i>Note: Connected TCP clients (remote IP = 192.168.0.2 and 192.168.10.20). TCP server listening on local port 80 for connection index from 1 to3)</i>

## 5.1.7. Notes

The maximum number of sockets can be set to 23 so that WIPsoft can handle in the same time either one FTP session (in passive mode)/HTTP/SMTP/POP3, 8 UDP sockets, 8 TCP client sockets and 4 TCP servers.

Starting a TCP server requires to specify the maximum number of communication sockets that can be spawned. This can be done using <from idx> and <to idx> parameters. Note that the value set for <to idx> should be equal or more than <from idx>.

The maximum communication socket that can be created using WIPsoft is 8. Hence, the range for <communication index> and <from idx>, <to idx> is 1-8. Note that the spawned communication socket and the TCP client socket share the same communication index.

It is not possible to create a client socket with AT+WIPCREATE=2, x, y, z when x is already reserved by a server with AT+WIPCREATE=3, <server idx>, <local port>, a, b where  $a \leq x \leq b$ . Similarly, it is not possible to reserve a range with AT+WIPCREATE=3, <server idx>, <local port>, a, b if one of the TCP client socket indexes between a and b is already reserved, be it by a client or a server range

The <from idx> and <to idx> are reserved for the server socket till the server socket and the spawned sockets are closed explicitly. So when trying to create a new TCP server socket, the <from idx> and <to idx> should be different from what was used earlier. A parameter used as <from\_idx> can't be used as <to\_idx> anymore for other TCP server socket creation until spawned sockets with specified <from\_idx> and <to\_idx> are closed along with the TCP server socket explicitly and vice versa.

When no more communication index is available in the TCP server's range (or no more resources to accept new incoming connections), any peer trying to connect to the server will receive an accept () immediately followed by a shutdown () ("peer close").

It is possible to have a TCP client and TCP server sockets running at the same time in the same Wireless CPU. In this scenario, when the connection is established between the TCP server and TCP client sockets, it is necessary to unmap the mapped socket on one index in order to send/receive data on socket which is created on another index. It is possible to use CMUX logical ports and can have an interface connection (like UART connection) for each socket for e.g. TCP client socket on one logical port and TCP server socket on another. In this case, it is not necessary to map or unmap the UART connections to send or receive the data from the socket.

The +WIPCREATE command causes the connection and authentication to the FTP server. If several file uploads and retrievals are required to/from the same server, a single connection with +WIPCREATE is needed. Then, each file operation will be done (one +WIPFILE command per operation), and the FTP connection will be released with +WIPCLOSE.

SIM card is required only if FTP session is established through GSM or GPRS. An FTP session upon an UART will work without a SIM card.

## 5.2. Closing a Service +WIPCLOSE

### 5.2.1. Description

The +WIPCLOSE command is used to close a socket or FTP/HTTP/SMTP/POP3/MMS session. When one serial port (UART or CMUX DLCI) is used to map a socket for read/write operations, [ETX] character can also be used to close the socket.

An unsolicited event is generated, when socket or FTP/HTTP/SMTP/POP3/MMS session is closed.

### 5.2.2. Syntax

*Action command*  
**AT+WIPCLOSE=<protocol>,<idx>**  
 OK

*Read Command*  
**AT+WIPCLOSE?**  
 NONE

*Test Command*  
**AT+WIPCLOSE=?**  
 OK

*Unsolicited response*  
 +WIPPEERCLOSE: <protocol>,<idx>

### 5.2.3. Parameters and Defined Values

<b>&lt;protocol&gt;:</b>	protocol type
1	UDP
2	TCP client
3	TCP server
4	FTP

	5	HTTP
	6	SMTP
	7	POP3
	8	MMS
<b>&lt;idx&gt;:</b>		socket identifier or FTP/HTTP/SMTP/POP3 session identifier  This parameter is the index of the socket or FTP/HTTP/SMTP/POP3 session created with +WIPCREATE command.

### 5.2.4. Parameter Storage

None

### 5.2.5. Possible Errors

“+CMEE” AT error code	Description
802	not enough memory
803	operation not allowed in the current WIP stack state
830	bad index
831	bad state
834	not implemented
837	bad protocol

### 5.2.6. Examples

Command	Responses
<b>AT+WIPCLOSE=1,1</b>	OK
<i>Note: Close UDP socket with communication index 1</i>	
<b>AT+WIPCLOSE=2,1</b>	OK
<i>Note: Close TCP client with communication index 1</i>	
<b>AT+WIPCLOSE=3,1</b>	OK
<i>Note: Close TCP server with communication index 1</i>	
<b>AT+WIPCLOSE=4,1</b>	OK
<i>Note: Close FTP session with index 1</i>	<i>Note: An unsolicited event +WIPPEERCLOSE: 4,1 is received once the FTP session is closed</i>
<b>AT+WIPCLOSE=5,1</b>	OK
<i>Note: Close HTTP session with index 1</i>	

Command	Responses
<b>AT+WIPCLOSE=6,1</b>	OK
<i>Note: Close SMTP session with index 1</i>	
<b>AT+WIPCLOSE=7,1</b>	OK
<i>Note: Close POP3 session with index 1</i>	
<b>AT+WIPCLOSE=8,1</b>	OK
<i>Note: Close MMS session with index 1</i>	

## 5.2.7. Notes

After issuing +WIPCLOSE command, no more data can be sent and received over the socket/session. In case of FTP protocol, the closure of FTP session is indicated by +WIPEERCLOSE unsolicited response when +WIPCLOSE command is used for closing the session.

In case of TCP and UDP sockets, response "OK" is returned when the +WIPCLOSE command is executed irrespective of whether the socket is active or not. But in case of FTP/HTTP/SMTP/POP3 session, "OK" response is returned if +WIPCLOSE command is executed when the session is active else "+CME ERROR: 831" error code is returned.

## 5.3. Service Option Handling +WIPOPT

### 5.3.1. Description

The +WIPOPT command is used to read and/or to configure different parameters on sockets and FTP/HTTP/SMTP/POP3/MMS service.

### 5.3.2. Syntax

- if <action>=1

*Action Command*

```
AT+WIPOPT=<protocol>,<idx>,<action>,<optnum>
```

OK

- if <action>=2 and <protocol> does not equal 8

*Action Command*

```
AT+WIPOPT=<protocol>,<idx>,<action>,<optnum>,<optval>
```

OK

- if <action>=2 and <protocol>=8

*Action Command*

```
AT+WIPOPT=<protocol>,<idx>,<action>,<optnum>,<optval>  
[,<optval2>,[<optval3>],[<optval4>]]
```

OK

*Read Command*

```
AT+WIPOPT?
```

NONE

*Test Command*

```
AT+WIPOPT=?
```

OK

- if <action>=1

*Unsolicited response*

```
+WIPOPT: <protocol>, <optnum>, <optval>
```

if <action>=1 and <protocol>=5 and <optnum>=54

*Unsolicited response*

```
+WIPOPT: 5, 54, <message header field name>, <message header field value>, [...]
```

### 5.3.3. Parameters and Defined Values

<b>&lt;protocol&gt;:</b>	protocol type
1	UDP
2	TCP client
3	TCP server
4	FTP
5	HTTP
6	SMTP
7	POP3
8	MMS
<b>&lt;idx&gt;:</b>	socket or FTP/HTTP/SMTP/POP3/MMS session identifier
<b>&lt;action&gt;:</b>	requested operation
1	read the value of an option
2	write the value of an option
<b>&lt;optnum&gt;:</b>	option that can be read/written
<b>&lt;optval&gt;:</b>	value of an option
<b>&lt;optval2&gt;:</b>	value of an extra option (optional)
<b>&lt;optval3&gt;:</b>	value of an extra option (optional)
<b>&lt;optval4&gt;:</b>	value of an extra option (optional)

### 5.3.4. Parameter Storage

None

### 5.3.5. Possible Errors

<b>“+CMEE” AT error code</b>	<b>Description</b>
800	invalid option
801	invalid option value
803	operation not allowed in the current WIP stack state
830	bad index
834	not implemented
835	option not supported
837	bad protocol
850	invalid channel option or parameter value (for example, HTTP user name too long)
860	protocol undefined or internal error
863	protocol delete error
864	protocol list error

### 5.3.6. Examples

<b>Command</b>	<b>Responses</b>
<b>AT+WIPOPT=2,1,2,8,20</b> <i>Note: Set TTL for TCP client</i>	OK
<b>AT+WIPOPT=2,1,1,8</b> <i>Note: Get TTL for TCP client</i>	+WIPOPT: 2,8,20 OK
<b>AT+WIPOPT=3,1,2,9,10</b> <i>Note: Set TOS for TCP server</i>	OK
<b>AT+WIPOPT=3,1,1,9</b> <i>Note: Get TOS for TCP server</i>	+WIPOPT: 3,9,10 OK
<b>AT+WIPOPT=1,1,1,1</b> <i>Note: Get peer port for UDP</i>	+WIPOPT: 1,1,80 OK
<b>AT+WIPOPT=4,1,2,40,1</b> <i>Note: Set data representation type for FTP</i>	OK
<b>AT+WIPOPT=4,1,1,40</b> <i>Note: Get data representation type for FTP</i>	+WIPOPT: 4,1,1 OK
<b>AT+WIPOPT=5,1,2,52,0</b> <i>Note: Set HTTP version to 1.0</i>	OK
<b>AT+WIPOPT=5,1,2,53,6</b> <i>Note: Set maxredirect to 6</i>	OK

Command	Responses
<b>AT+WIPOPT=5,1,1,52</b>	+WIPOPT: 5,52,0 OK
<i>Note: Get HTTP version</i>	
<b>AT+WIPOPT=6,1,2,61,"senderaddresses@mail.com"</b>	OK
<i>Note: Set the sender address</i>	
<b>AT+WIPOPT=6,1,2,67,0</b>	OK
<i>Note: The application will format the mail header and send it during the data sending phase</i>	
<b>AT+WIPOPT=6,1,1,61</b>	+WIPOPT: 6,61,"senderaddress@mail.com" OK
<i>Note: Get the sender address</i>	
<b>AT+WIPOPT=6,1,1,60</b>	+WIPOPT:6,60,220,"220 innosoft.com SMTP service ready" OK
<i>Note: Get last protocol error / status</i>	
<b>AT+WIPOPT=6,1,1,66</b>	+WIPOPT: 6,66,"My mail subject" OK
<i>Note: Get the set mail subject</i>	
<b>AT+WIPOPT=7,1,1,72</b>	+WIPOPT: 7,72,243000 OK
<i>Note: Get total mail size</i>	
<b>AT+WIPOPT=7,1,1,73</b>	+WIPOPT: 7,73,"1,1024" +WIPOPT: 7,73,"2,5237" +WIPOPT: 7,73,"3,128" +WIPOPT: 7,73,"4,36400" +WIPOPT: 7,73,"5,356" OK
<i>Note: Get mail listing</i>	
<b>AT+WIPOPT=7,1,2,74,10</b>	+WIPOPT: 7,74,10 OK

Command	Responses
<i>Note: Delete mail ID 10</i>	
<b>AT+WIPOPT=8,1,2,82,"Mr Smith &lt;mr.smith@example.com"</b>	+WIPOPT: 8,75, "Mr Smith <mr.smith@example.com"  OK
<i>Note: Add an email address to the To-field of an MMS.</i>	

### 5.3.7. Notes

It is possible to change and retrieve option value using +WIPOPT command only when the socket/session (given by <idx>) is active else it returns error.

#### 5.3.7.1. Options that can be applied to UDP, TCP Client, TCP Server Sockets

opt num	Value format	Option Type	Description	UDP	TCP client	TCP server
0	0-65535	WIP_COPT_PORT	Port of the socket	R	R	R
1	0-65535	WIP_COPT_PEER_PORT	Port of the peer socket	R	R	-
2	string	WIP_COPT_PEER_STRADDR	Address of the peer socket	R	R	-
3	0-1	WIP_COPT_BOUND	Specifies whether the socket is bounded <sup>2</sup> to a peer socket or not default: 1	R	-	-
4	1-5839	WIP_COPT_SND_LOWAT	Minimum amount of available space that must be available in the emission buffer before triggering a WIP_CEV_WRITE event default: 1024	-	RW	RW
6	0-65535	WIP_COPT_NREAD	Number of bytes that can currently be read on that socket default: 0	R	R	-

opt num	Value format	Option Type	Description	UDP	TCP client	TCP server
7	0-1	WIP_COPT_NODELAY	When set to TRUE, TCP packets are sent immediately, even if the buffer is not full enough. When set to FALSE, the packets will be sent either, a) by combining several small packets into a bigger packet b) when the data is ready to send and the stack is idle. default: 0	-	RW	RW
8	0-255	WIP_COPT_TTL	Time-to-live for packets default: 64	RW	RW	RW
9	0-255	WIP_COPT_TOS	Type of service default: 0	RW	RW	RW

2 The option WIP\_COPT\_BOUND is used to check whether an UDP socket is bound to any other UDP socket or not. When the UDP socket is created without specifying the IP address of the peer, then the option WIP\_COPT\_BOUND will be read as FALSE. This is because there is no destination IP address to communicate with. If the UDP socket is created by specifying the peer IP address, the option WIP\_COPT\_BOUND will be read as TRUE. This is because the peer IP address will be resolved by the DNS and the socket is said to be bounded to the peer socket. Hence this option will be read as TRUE.

### 5.3.7.2. Options that can be applied to FTP Session

opt num	Value format	Value type	Description
40	0-1	boolean	data representation type. 0: ASCII 1: binary default: 0
41	0-1	boolean	FTP mode. 0: active 1: passive default: 1

### 5.3.7.3. Options that can be applied to HTTP Session

opt num	Value format	Value type	Option type	Description	Type
50		u32	WIP_COPT_RCV_BUFSIZE	set the size of the TCP socket receive buffer default: 0	RW

opt num	Value format	Value type	Option type	Description	Type
51		u32	WIP_COPT_SND_BUFSIZE	set the size of the TCP socket send buffer. default: 0	RW
52	0-1	u8	WIP_COPT_HTTP_VERSION 0: HTTP 1.0 1: HTTP 1.1	define the HTTP version to be used by the session default: 1	RW
53		u32	WIP_COPT_HTTP_MAXREDIRECT	set the maximum number of allowed redirects a zero value disables automatic redirects default: 8	W
54		<ascii list>	WIP_COPT_HTTP_HEADER	return the HTTP message header field (or a list of message header fields) from the last WIPFILE call default: depends on the HTTP server	R

**Caution:** Option 54 (WIP\_COPT\_HTTP\_HEADER) is not implemented and hence attempt to read this option will result in +CME ERROR: 834.

#### 5.3.7.4. Options that can be applied to SMTP Session

opt num	Value format	Value type	Option type	Description	Type
60	digit/string	u32/ascii	WIP_COPT_SMTP_STATUS_CODE	get last protocol error code and associated error string default: NULL string	R
61	string	ascii	WIP_COPT_SMTP_SENDER	set the sender address default: NULL string	RW
62	string	ascii	WIP_COPT_SMTP_SENDERNAME	set the sender name default: NULL string	RW
63	string	ascii	WIP_COPT_SMTP_REC	set the recipients list default: NULL string	RW
64	string	ascii	WIP_COPT_SMTP_CC_REC	set the CC recipients list default: NULL string	RW
65	string	ascii	WIP_COPT_SMTP_BCC_REC	set the BCC recipients list default: NULL string	RW
66	string	ascii	WIP_COPT_SMTP_SUBJ	set the mail subject default: NULL string	RW
67	digit	u32	WIP_COPT_SMTP_FORMAT_HEADER	decide if the SMTP library will format the mail header or if the application is in charge of formatting it 0: Application formats mail header 1: SMTP lib formats mail header default: 1	RW

**Caution:** When option `WIP_COPT_SMTP_FORMAT_HEADER` is set to 0, application can format the mail header to attach documents (see RFC 2822 for Standard for the Format of ARPA Internet Text Messages for formatting details). Note that `+WIPFILE` command is used to send both mail header and body.

**Caution:** When option `WIP_COPT_SMTP_STATUS_CODE` is used to retrieve the error code and the associated error string for the SMTP session creation, it will not return any error code and error string if no error occurred during that particular SMTP session creation. For example, After the SMTP session is created successfully, an attempt to retrieve the error code and the associated error string, using the option `WIP_COPT_SMTP_STATUS_CODE`, will result in an error code "0" and the error string corresponding to the successful case. Create a SMTP session for the second time which will result in the "+CME ERROR: 840" error code because the session is already active. Now an attempt to retrieve the error code along with the associated error string, using the option `WIP_COPT_SMTP_STATUS_CODE`, will result in error code "0" and the associated error string because the first SMTP session was successful.

### 5.3.7.5. Options that can be applied to POP3 Session

opt num	Value format	Value type	Option type	Description	Type
70	digit/string	u32/ascii	WIP_COPT_POP3_STATUS_CODE	get last protocol error code and associated error string	R
71		u32	WIP_COPT_POP3_NB_MAILS	get total number of mails default: depends on the mails available in the mail box	R
72		u32	WIP_COPT_POP3_MAILSIZE	get total mail size default: depends on the mails available in the mail box	R
73	digit/string	ascii	not a POP3 wip option	get mail listing The return value is a list of strings containing mail ID and mail size information. default: depends on the mails available in the mail box	R
74		u32	not a POP3 wip option	delete the mail ID The mail ID corresponds to the mail ID returned by the mail listing option. default: depends on the mails available in the mail box	W

**Caution:** When option `WIP_COPT_POP3_STATUS_CODE` is used to retrieve the error code and the associated error string for the POP3 session creation, it will not return any error code and error string if no error occurred during that particular POP3 session creation.

For example, after the SMTP session is created successfully, an attempt to retrieve the error code and the associated error string, using the option `WIP_COPT_POP3_STATUS_CODE`, will result in an error code "0" and the error string corresponding to the successful case. Create a POP3 session for the second time which will result in the "+CME ERROR: 840" error code because the session is already active. Now an attempt to retrieve the error code along with the associated error string, using the option `WIP_COPT_POP3_STATUS_CODE`, will result in error code "0" and the associated error string because the first POP3 session was successful

### 5.3.7.6. Options that can be applied to MMS sessions

opt num	Value format	Value type	Option type	Description	Type
80	u32	u32	WIP_MMS_DATE	Set the value of the date and time of the MMS in the following format : <i>Month/Day/Year Hour:Min:Sec</i>	RW
81	string	ascii	WIP_MMS_TO_PHONE*	Adds a telephone number to the TO field in the MMS	RW
82	string	ascii	WIP_MMS_TO_EMAIL*	Adds an email address to the TO field in the MMS	RW
83	string	ascii	WIP_MMS_CC_PHONE*	Adds a telephone number to the CC field in the MMS	RW
84	string	ascii	WIP_MMS_CC_EMAIL*	Adds an email address to the CC field in the MMS	RW
85	string	ascii	WIP_MMS_BCC_PHONE*	Adds a telephone number to the BCC field in the MMS	RW
86	string	ascii	WIP_MMS_BCC_EMAIL*	Adds an email address to the BCC field in the MMS	RW
87	string	ascii	WIP_MMS_SUBJECT	Set the value of the Subject field in the MMS	RW
88	See <a href="#">Table</a>	u32	WIP_MMS_CLASS	Set the class of the MMS	RW
89	See <a href="#">Table</a>	u32	WIP_MMS_PRIORITY	Set the priority of the MMS	RW
90	u32	u32	WIP_MMS_SENDER_VISIBILITY	Set the sender visibility of the MMS show=0 default hide=1	RW
91	string	ascii	WIP_MMS_FROM	Set the sender of the MMS	RW
92	u32	u32	WIP_MMS_MULTIPART_TYPE	Set the value of the MMS Multipart Type via <optval> as u32. Mixed=0 default. Related=1.  In the case of "Related" the presentation file type is sent in <optval2> as a string and the start file identification is sent in <optval3> as a string.	RW
93	See <a href="#">Table</a>	u32	WIP_MMS_ADD_FILE	About to attach a file of type specified in <optval> as u32, please see Table 5.3.7.6.1 for possible values. The size in Bytes as u32 is sent in <optval2>. The file name is sent as a string in <optval3> Content-id is sent in <optval4>. At least one of either file name or content-id must be set!	W

opt num	Value format	Value type	Option type	Description	Type
94	string	ascii	WIP_MMS_ADD_FILE_ANY	About to attach a file of type specified in <optval> as a string using the format of mime-type, Example "image/xyz". The size in Bytes is sent in <optval2>. The file name is sent as a string in <optval3> Content-id is sent in <optval4>. At least one of either file name or content-id must be set.	W
95	u32	u32	WIP_MMS_HTTP_DATA_ENCOD	Set the HTTP data transfer encoding no encoding=0 chunked data transfer encoding=1 default.	RW
96		-	WIP_MMS_DONE	Sent as the last command to signal that the MMS sending is considered done. This is to catch deadlocks, when for instance a user misses to send a last file. <i>NOTE : Once the MMS is sent, the +WIPPEERCLOSE: 8,* is received to indicate that MMS session is closed. Therefore, there is no need to issue the AT+WIPCLOSE command to close it).</i>	

\* See the [Phone/Mail Option Notes](#) subsections for additional information about this option type.

**Caution:** For the WIP\_MMS\_ADD\_FILE and WIP\_MMS\_ADD\_FILE\_ANY options, the total MMS size depends on the application's available memory (if the application is linked with 256kBytes or 1MBytes+ of RAM memory).

- For 256kBytes (WIPSoft Application) total MMS size must not exceed 150kBytes.
- For 1MBytes+ (Extended AT Application) total MMS size must not exceed 300kBytes.

### 5.3.7.6.1. Values of <optval> WIP\_MMS\_CLASS

These are the different types of message class.

optval	Option Type
0	PERSONAL default
1	INFORMATIONAL
2	ADVERTISEMENT
3	AUTO

### 5.3.7.6.2. Values of <optval> WIP\_MMS\_PRIORITY

These are the different types of priority.

optval	Option Type
0	LOW
1	NORMAL default
2	HIGH

### 5.3.7.6.3. Values of <optval> WIP\_MMS\_ADDFILE

These are the file types that correspond to the values predefined in the MMS header specification. For other types of file the MIME type has to be explicitly set as a string.

optval	Option Type	Description
0	UTF8	A text file of type UTF8
1	UTF16	A text file of type UTF16
2	UCS2	A text file of type USC2
3	US_ASCII	A text file of type (US) ASCII
4	JPEG	An image file of type JPEG
5	GIF	An image file of type GIF
6	TIFF	An image file of type TIFF
7	PNG	An image file of type PNG
8	WBMP	An image file of type WBMP
9	SMIL	A multimedia presentation of type SMIL

### 5.3.7.6.4. Phone/Mail Option Notes

#### 5.3.7.6.4.1. Recipients

The total number of recipient (To+Cc+Bcc) must be less than or equal to 12, and for each recipient list (To or Cc or Bcc), the string length must be less than 250 characters, including "/TYPE=PLMN" in case of phone recipient type.

#### 5.3.7.6.4.2. Command and Response

When getting WIP\_MMS\_TO\_PHONE/WIP\_MMS\_TO\_MAIL or WIP\_MMS\_CC\_PHONE/WIP\_MMS\_CC\_MAIL or WIP\_MMS\_BCC\_PHONE/WIP\_MMS\_BCC\_MAIL string is received in +WIPOPT, the response will include the complete TO or CC or BCC recipient list, preceded by TYPE/PLMN for phone recipient type. For example:

If you enter

AT+WIPOPT=8,1,2,81,"0683517984" (set WIP\_MMS\_TO\_PHONE option)

then

AT+WIPOPT=8,1,2,82,ovc@sierrawireless.com (set WIP\_MMS\_TO\_MAIL option)

After entering AT+WIPOPT=8,1,1,81 (get WIP\_MMS\_TO\_PHONE option) or AT+WIPOPT=8,1,1,82 (get WIP\_MMS\_TO\_MAIL option), the response will be:

+WIPOPT: 8,82,"0683517984/TYPE=PLMN;ovc@sierrawireless.com"

## 6. Data Exchange for Protocol Services

The section deals with the data exchange for the services over TCP/IP. All the commands required for the data exchange through different services are mentioned in succeeding sections.

### 6.1. File Exchange +WIPFILE

#### 6.1.1. Description

The +WIPFILE command defines the “file system” services that send a block of data through standard TCP/IP protocols. This command is used for file transfer/reception.

The data can be transferred using two modes: continuous mode and continuous transparent mode. The FTP/HTTP/SMTP/MMS protocols support continuous mode of operation. But, continuous transparent mode is supported only by FTP protocol.

By default, all these protocols transfer data using continuous mode. However, data transfer using FTP protocol can be configured using <dle\_mode> parameter.

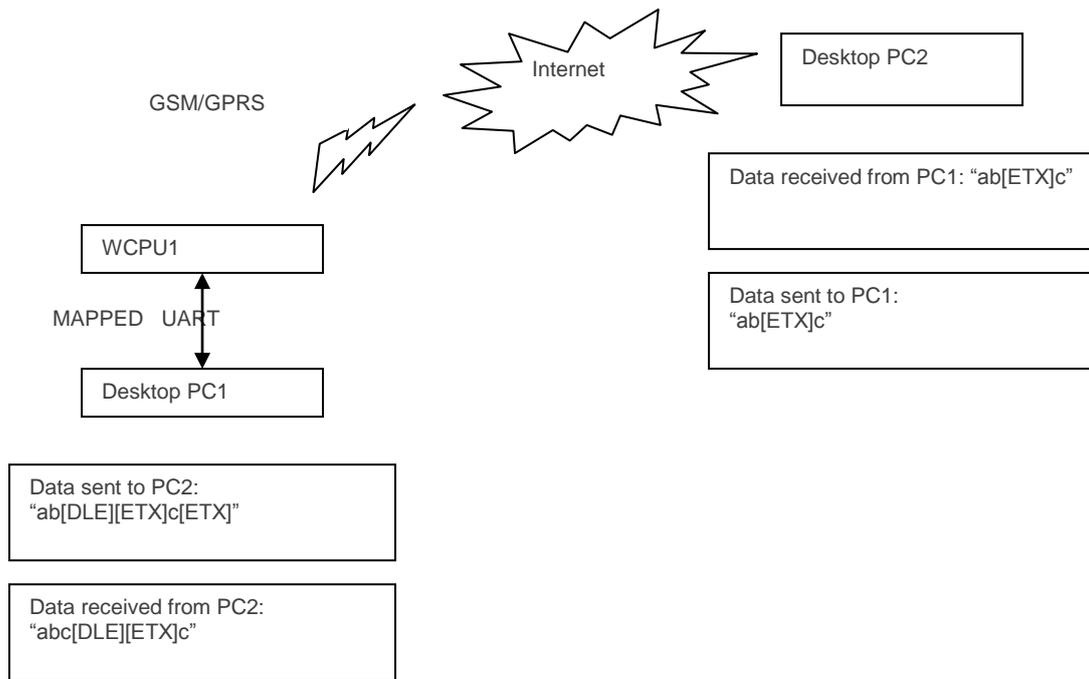

---

*Note:* There is no <dle\_mode> parameter specified in the +WIPFILE command to configure mode of operation for HTTP/SMTP protocol.

---

##### 6.1.1.1. [ETX] Escaping Mechanism

In case an [ETX] character needs to be transmitted as data, it should be preceded by [DLE] character. A single [ETX] character marks the end of transmission. Similarly, [ETX] characters received from the internet are sent to the host through the serial port preceded by a [DLE] character.

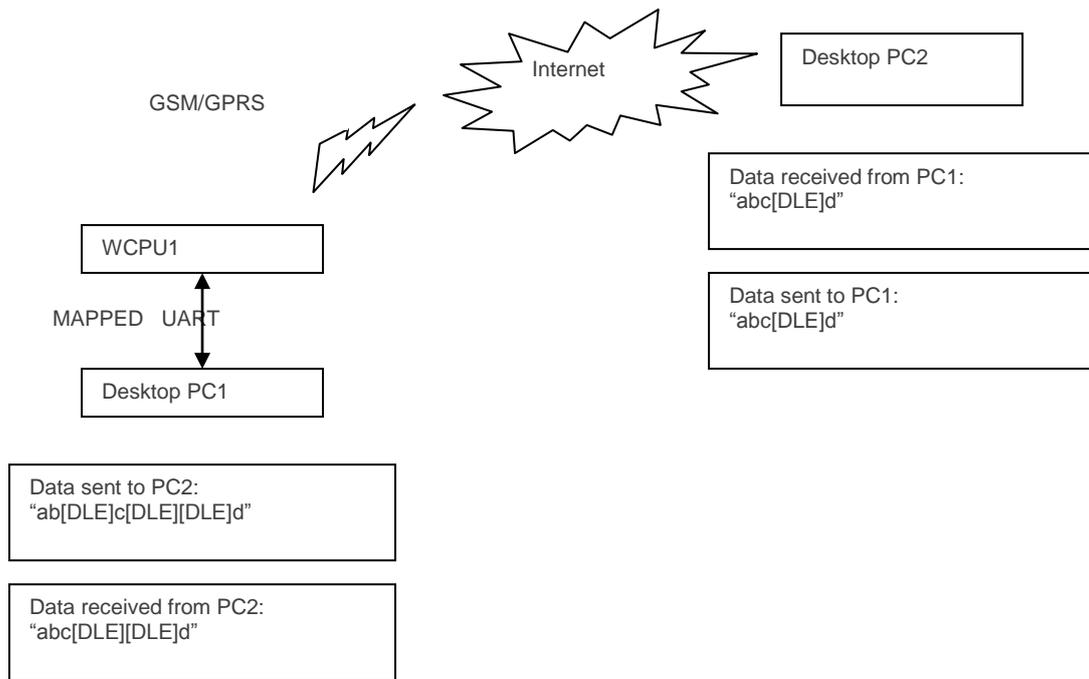

The above schematic explains how [ETX] characters which have a special meaning in WIPsoft are handled on Sierra Wireless embedded module.

On transmitting side, when [ETX] characters are escaped by a DLE (use case: Desktop PC1 sends data to the embedded module. Data contains an [ETX] character escaped by a [DLE] character ([DLE] [ETX] sequence), then the [ETX] character is transmitted as data.

On the receiving side, when [ETX] character is received as data (use case: The PC2 sends data to the embedded module. Data contains an [ETX] character), then the [ETX] character will be preceded by a [DLE] character when it is sent to host through the serial port.

### 6.1.1.2. [DLE] Escaping Mechanism

In case a [DLE] character needs to be transmitted as data, it should be preceded by another [DLE] character. A single [DLE] character, not preceded by a [DLE] character will not be transmitted. Similarly, [DLE] characters received are sent to the host through the serial port preceded by a [DLE] character.

The above schematic explains how [DLE] characters which have a special meaning in WIPsoft are handled on Sierra Wireless embedded module.

On the transmitting side, when [DLE] characters are escaped by another [DLE] character (use case: Desktop PC1 sends data to the embedded module. Data contains a non escaped [DLE] character, and another escaped [DLE] character ([DLE][DLE] sequence), then the [DLE] character is transmitted as data. A single [DLE] character is ignored and not transmitted.

On the receiving side, when [DLE] character is received as data (use case: The PC2 sends data to the embedded module. Data contains an [DLE] character), then the [DLE] character will be preceded by another [DLE] character when it is sent to host through the serial port.

### 6.1.2. FTP/HTTP/SMTP Session in Continuous Mode

In continuous mode, an [ETX] character is considered as an end of data. In case an [ETX]/[DLE] character needs to be transmitted as data, it should be preceded by [DLE] character. Similarly, [ETX]/[DLE] characters received by the TCP/IP stack from the internet are sent to the host through the serial port preceded by a [DLE] character.

The mapped UART can be switched back to AT mode either by:

1. sending ETX character
2. sending +++ sequence with 1 second guard time before and after the sequence
3. controlling the DTR signal using AT&D command

When the UART leaves data mode, the currently unsend data are transferred.

### 6.1.3. FTP Session in Continuous Transparent Mode

In this mode, [DLE]/[ETX] characters are considered as normal data and not as special characters. In case [ETX]/[DLE] character is received, it will not be preceded by a [DLE] character before sending it to the mapped UART.

The mapped UART can be switched back to AT mode either by,

1. sending +++ sequence with 1 second guard time before and after the sequence
2. controlling the DTR signal using AT&D command

When the UART leaves data mode, the currently unsent data are transferred.

### 6.1.4. Syntax

- if <protocol>=4

*Action Command*

**AT+WIPFILE=<protocol>,<index>,<mode>,<filename>[,<dle\_mode>]**

CONNECT

...

OK

- if <protocol>=5

*Action Command*

**AT+WIPFILE=<protocol>,<index>,<mode>,<filename>[,<username>,<password>][,<headers list>[...]]**

CONNECT

...

OK

- if <protocol>=6

*Action Command*

**AT+WIPFILE=<protocol>,<index>,<mode>**

CONNECT

...

OK

- if <protocol>=7

*Action Command*

**AT+WIPFILE=<protocol>,<index>,<mode>,<filename>**

CONNECT

...

OK

- if <protocol>=8

*Action Command*

**AT+WIPFILE=<protocol>,<index>,<mode>,[<filename>],[<content-id>][<lastindicator>]**

CONNECT

...

OK

- if <protocol>=5

*Unsolicited response*

+WIPFILE: 5,<index>,<mode>,<http status code>,<http status reason>

*Read command*

**AT+WIPFILE?**

OK

*Test Command*

**AT+WIPFILE=?**

OK

## 6.1.5. Parameters and Defined Values

<b>&lt;...&gt;</b>	<p>additional HTTP message header fields</p> <p>more pairs(name, value) of HTTP message header field can be added</p>
<b>&lt;http status code&gt;:</b>	<p>HTTP 3 digit status code of the response</p>
<b>&lt;http status reason&gt;:</b>	<p>HTTP status reason of the response in string format</p>

<b>&lt;content-id&gt;</b>	MMS Content-id header
<b>&lt;lastindicator&gt;</b>	Indicates that the file is the last of the files to send.

<sup>1</sup>: See the [DATA Offline session +WIPDATARW](#) section for more information.

## 6.1.6. Parameter Storage

None

## 6.1.7. Possible Errors

<b>“+CMEE” AT error code</b>	<b>Description</b>
800	invalid option
801	invalid option value
803	operation not allowed in the current WIP stack state
830	bad index
831	bad state
834	not implemented
836	memory allocation error
837	bad protocol
839	error during channel creation
846	internal error: FCM subscription failure
860	protocol undefined or internal error
867	POP3 email retrieving error
868	POP3 email size error
880	SMTP sender email address rejected by server
881	SMTP recipient email address rejected by server
882	SMTP CC recipient email address rejected by server
883	SMTP BCC recipient email address rejected by server
884	SMTP email body send request rejected by server
890	Service denied
891	Message format corrupt
892	Address unresolved
893	Message not found
894	Network problem
895	Content not accepted
896	Unsupported message
897	Unspecified error

## 6.1.8. Examples

Command	Responses
<b>AT+WIPFILE=4,1,1,"data.bin"</b>	CONNECT <data received terminated by [ETX] character>
<i>Note: Download file in continuous mode</i>	OK
<b>AT+WIPFILE=4,1,2,"report.log"</b>	CONNECT <data terminated by [ETX] character>
<i>Note: Upload file in continuous mode</i>	OK
<b>AT+WIPFILE=4,1,5,"report.log"</b>	CONNECT <data terminated by [ETX] character>
<i>Note: Upload file in continuous mode; data will be added at the end of file</i>	OK
<b>AT+WIPFILE=4,1,1,"data.bin",1</b>	CONNECT <data> +++
	OK
<i>Note: Download file in continuous transparent mode</i>	<i>Note; +++ sequence causes the UART to switch to AT mode</i>
<b>AT+WIPFILE=4,1,2,"report.log",1</b>	CONNECT <data> +++
	OK
<i>Note: Upload file in continuous transparent mode</i>	<i>Note; +++ sequence causes the UART to switch to AT mode</i>
<b>AT+WIPFILE=4,1,1,"data.bin",0</b>	CONNECT <data received terminated by [ETX] character>
<i>Note: Download file in continuous mode</i>	OK
<b>AT+WIPFILE=4,1,2,"report.log",0</b>	CONNECT <data terminated by [ETX] character>
<i>Note: Upload file in continuous mode</i>	OK
<b>AT+WIPFILE=5,1,2,"urlForPut"</b>	CONNECT <data terminated by [ETX] character> OK +WIPFILE:5,1,2,<http status code>,<http status reason>

Command	Responses
<i>Note: Send a HTTP PUT request to URL</i>	
<b>AT+WIPFILE=5,1,3,"urlForDelete"</b>	CONNECT <data received terminated by [ETX] character> OK +WIPFILE:5,1,3,<http status code>,<http status reason>
<i>Note: Send a HTTP DELETE request to URL</i>	
<b>AT+WIPFILE=5,1,4,"urlForPost"</b>	CONNECT <data received terminated by [ETX] character> OK +WIPFILE:5,1,4,<http status code>,<http status reason>
<i>Note: Send a HTTP POST request to URL</i>	
<b>AT+WIPFILE=6,1,2</b>	CONNECT <data sent terminated by [ETX] character> OK
<i>Note: Send data mail content</i>	
<b>AT+WIPFILE=7,1,1,"15"</b>	CONNECT <data received terminated by [ETX] character > OK
<i>Note: Retrieve data from the given ID</i>	<i>Note: Retrieve mail ID 15 Mail is not deleted after retrieval</i>
<b>AT+WIPFILE=7,1,3,"1"</b>	CONNECT <data received terminated by [ETX] character > OK
<i>Note: Retrieve data from the given ID</i>	<i>Note: Retrieve mail ID 1 and delete it after retrieval</i>

## 6.1.9. Notes

The [ETX] character is considered as an end of data. Hence, in case [ETX] character needs to be transmitted, it should be preceded by [DLE] character.

For MMS, when sending file data through AT+WIPFILE command, if data size is greater than the one specified via WIP\_MMS\_ADD\_FILE or WIP\_MMS\_ADD\_FILE\_ANY options, the data will be truncated to said option's size, and module will leave the data mode. When going back to AT mode, +WIPFILE: proto,index,size will be received with the size equal to the size of the data that will be included in the MMS file.

## 6.2. Socket Data exchange +WIPDATA

### 6.2.1. Description

The +WIPDATA command is used to read/write from/to a socket. On successful execution of the command, the UART switches to data mode. The UART can be switched back to AT mode by sending “+++” with 1 second guard time before and after the sequence. If data is not read using +WIPDATA command, further data will be delayed.

An unsolicited event is received when there is a data to read on socket.

Data can be sent on the sockets using two modes

- continuous mode
- continuous transparent mode

---

*Note:* When using the UDP protocol, consider that you cannot send more than the WIP\_COPT\_RCV\_BUFSIZE data receiving buffer size. Based on this, be sure that no data will be lost, as it depends on the bearer "speed".

---

### 6.2.2. Continuous Mode

#### 6.2.2.1. TCP Sockets in Continuous mode

In continuous mode, an [ETX] character is considered as an end of data. When an [ETX] character is sent on the mapped UART, the TCP socket is shutdown and the peer side is informed of this shutdown with the indication “[CR][LF]SHUTDOWN[CR][LF]” on the mapped UART.

In case an [ETX]/[DLE] character needs to be transmitted as data, it should be preceded by [DLE] character. Similarly, [ETX]/[DLE] characters received by the TCP/IP stack from the internet are sent to the host through the serial port preceded by a [DLE] character.

To close sockets, switch the UART to AT command mode and use +WIPCLOSE command.

#### 6.2.2.2. UDP Sockets in Continuous mode

UDP is a connectionless protocol and hence there is no way to detect or cause a shutdown. However, an [ETX] character is used to mark the boundaries of datagrams.

All data written on an UDP socket is collected till an [ETX] character is encountered or the maximum size of the datagram<sup>1</sup> is reached and will be sent as a single datagram. Similarly when reading data,

---

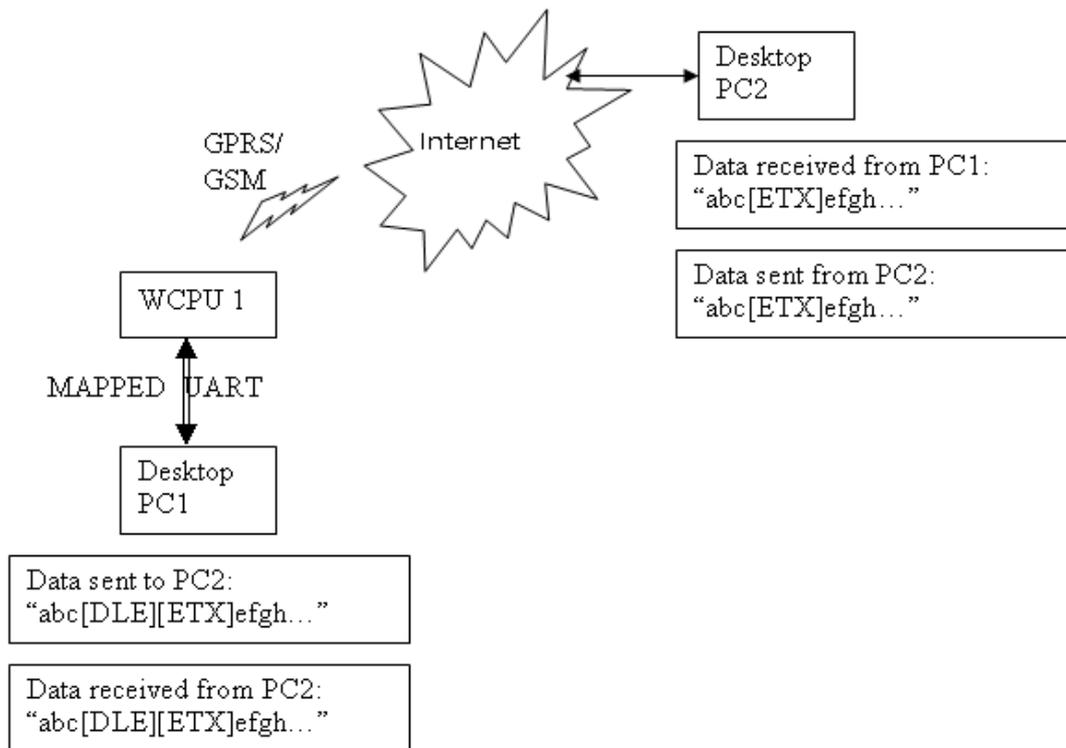

<sup>1</sup> Maximum size of an UDP datagram has been fixed to 5904 Bytes. This limit is an arbitrary one. Nevertheless, note that smaller the datagram is the surer it will reach the aimed destination. Note that UDP is not a reliable transport layer.

all data will be read till an [ETX] character is encountered which indicates the end of the datagram. Note that, in this mode, packet segmentation feature is not supported.

In case an [ETX]/[DLE] character needs to be transmitted, it should be preceded by [DLE] character similar to TCP socket.

When the UART leaves DATA mode, either because of “+++” escape sequence or because of an AT+WIPDATA=1, index, 0 on another UART, the currently unsent data are sent as a single datagram.

### 6.2.2.3. [ETX] Escaping Mechanism

The above schematic explains how [ETX] characters – which have a special meaning in WIPsoft – are handled on Sierra Wireless embedded module.

On transmitting side, when [ETX] are not escaped (use case: Desktop PC1 sends data towards embedded module. Data contain a non escaped [ETX] (⇔ no [DLE][ETX] sequence), then [ETX] is not transmitted but an action is done on embedded module regarding the concerned socket:

- UDP socket: a non escaped [ETX] marks the boundary of the current datagram to be sent. Datagram is immediately sent and the [ETX] is not sent towards the desktop PC2.
- TCP socket: a non escaped [ETX] causes a TCP shutdown operation on the transmitting direction: peer is informed that embedded module will not send any more data on that socket. Usually, peer will shutdown the other way (downlink) and this will result in a “peer close event” on the socket.

On receiving side, when [ETX] are not escaped (use case: embedded module sends data towards Desktop PC1. Data contain a non escaped [ETX] (⇔ no [DLE][ETX] sequence), then [ETX] means that a special “IP” event occurred on embedded module regarding the concerned socket:

- UDP socket: a non escaped [ETX] signals the boundary of the current received datagram.

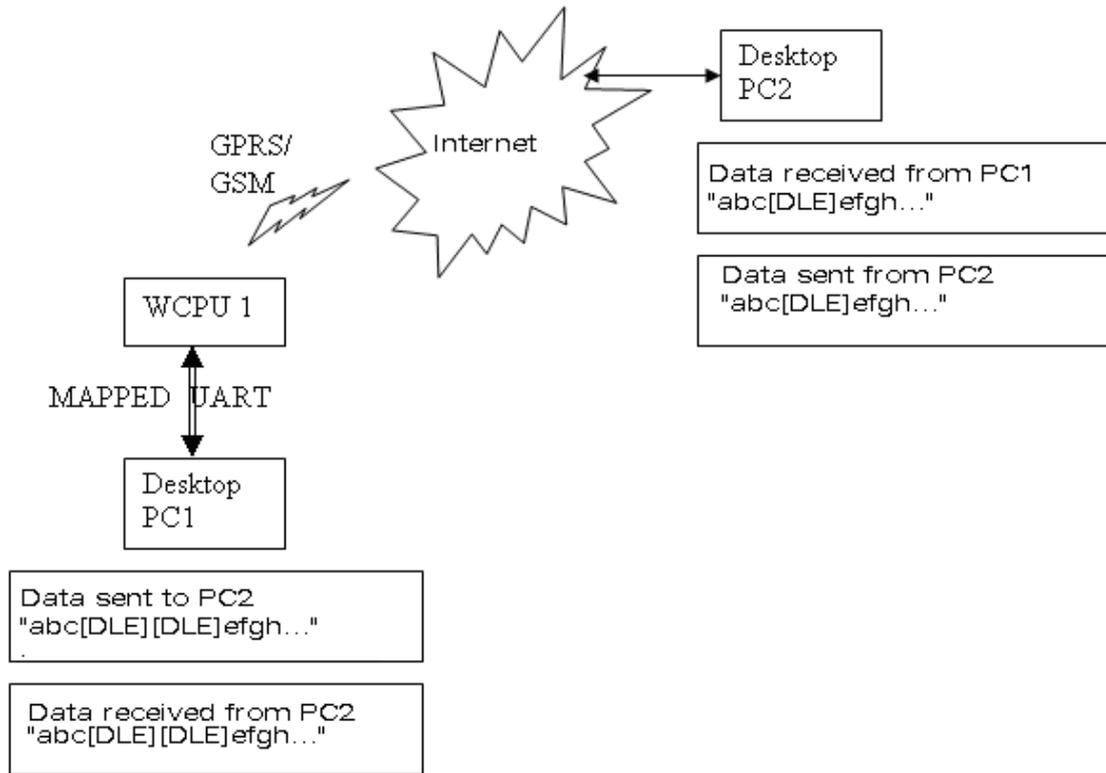

- TCP socket: a non escaped [ETX] signal that the peer TCP connected TCP unit shutdown the downlink way. Desktop PC1 should then close the uplink socket to totally terminate the TCP "session".

Protocol	Mapped UART	IP Network (active socket)
UDP	Data containing [DLE][ETX] sequence.	Data containing [ETX].
UDP	[ETX] alone.	Mark the boundary of the UDP Datagram received/to be transmitted.
TCP	Data containing [DLE][ETX] sequence.	Data containing [ETX].
TCP	[ETX] alone.	Causes/signals a shutdown operation on TCP socket.

*Note: The behavior is symmetrical: apply both on transmitting/receiving side of mapped UART.*

### 6.2.2.4. [DLE] Escaping Mechanism

A [DLE] character will be sent as data only when it is preceded by another [DLE] character. A single [DLE] character which is not preceded by a [DLE] character will not be transmitted.

The above schematic explains how [DLE] characters – which have a special meaning in WIPsoft – are handled on Sierra Wireless embedded module.

On transmitting side, when [DLE] is not escaped (use case: Desktop PC1 sends data towards embedded module. Data contains a non escaped [DLE] (⇔ no [DLE][DLE] sequence), then [DLE] is not transmitted.

On transmitting side, when [DLE] is escaped (use case: Desktop PC1 sends data towards embedded module. Data contain an escaped [DLE] (⇔ [DLE][DLE] sequence) then [DLE] data is transmitted.

On the receiving side (use case: when Desktop PC2 sends data towards embedded module. Data contains a no escaped [DLE]) the data sent from the embedded module to Desktop PC1 will contain an escaped [DLE] preceding the [DLE] character (Desktop PC1 receives [DLE][DLE] character from embedded module).

The scenario is same for both TCP and UDP sockets.

Protocol	Mapped UART	IP Network (active socket)
UDP	Data containing [DLE][DLE] sequence.	Data containing [DLE].

Protocol	Mapped UART	IP Network (active socket)
UDP	[DLE] alone.	A single [DLE] is ignored.
TCP	Data containing [DLE][DLE] sequence.	Data containing [DLE].
TCP	[DLE] alone.	A single [DLE] is ignored.

### 6.2.3. Continuous Transparent Mode

#### 6.2.3.1. TCP Sockets in Continuous Transparent Mode

In this mode there is no special meaning associated for [DLE]/[ETX] characters. They are considered as normal data and all the data will be transmitted on the mapped UART.

#### 6.2.3.2. UDP Sockets in Continuous Transparent Mode

In this mode there is no special meaning associated for [DLE]/[ETX] characters. They are considered as normal data and all the data will be transmitted on the mapped UART. In case [ETX]/[DLE] character is received, it will not be preceded by a [DLE] character before sending it to the mapped UART.

### 6.2.4. Leaving Continuous /Continuous Transparent Mode

The UART can be switched back to AT mode

- by sending “+++” with 1 second guard time before and after the sequence
- by sending an AT+WIPDATA=<proto.,<index>,0 on another UART in AT mode

When the UART leaves data mode either because of “+++” escape sequence or because of an unmapping done on another UART, the currently unsent data are sent as a single datagram.

## 6.2.5. Resetting TCP Sockets

A TCP socket is reset when the connection is aborted due to an error on the socket. When the socket is reset, an [ETX] character is sent on the mapped UART to indicate the end of communication. The mapped UART switches to AT mode and "+CME ERROR: 843" is displayed on the UART.

## 6.2.6. Syntax

### Action Command

**AT+WIPDATA=<protocol>,<idx>,<mode>[,<send size>,<wait time>]**

CONNECT

*Note:* Once the +WIPDATA indication has been received, on peer closed, +WPPEERCLOSE indication won't be received unless AT+WIPDATA has been sent.

### Read Command

**AT+WIPDATA?**

NONE

### Test Command

**AT+WIPDATA=?**

OK

- if <protocol>=1

### Unsolicited response

+WIPDATA: <protocol>,<idx>,<datagram size>,<peer IP>,<peer port>

**Caution:** Using +WIP AT commands, when receiving several UDP datagrams on an IP bearer, +WIPDATA indication is sent once for the first received datagram. Next indication (for next remaining UDP datagram to read) is sent once the first datagram have been read (using +WIPDATA command).

- if <protocol>=2

### Unsolicited response

+WIPDATA: <protocol>,<idx>,<number of readable bytes>

**Caution:** The value returned by <number of readable bytes> indicates that there is some TCP data ready to be read but number of bytes returned might not be reliable. Moreover, using +WIPAT commands, when receiving several TCP packets on an IP bearer, +WIPDATA indication is sent once for the first received packet. The next indication (for the next remaining TCP packet to read) is sent after the first packet have been read (using +WIPDATA command).

## 6.2.7. Parameters and Defined Values

<b>&lt;protocol&gt;:</b>	socket type	
	1	UDP
	2	TCP client
<b>&lt;idx&gt;:</b>	socket identifier	
<b>&lt;mode&gt;:</b>	mode of operation	
	0	unmap: switch the UART (mapped to continuous mode) to AT mode.
	1	continuous: switch the UART to data mode.
	2	continuous transparent: switch the UART to data mode. In this mode, [DLE]/[ETX] characters are considered as normal data and not special characters.
3	Data Offline: Activate Data Data Offline mode <sup>(1)</sup> on the specified socket.  In this mode, [DLE]/[ETX] characters are considered as normal data and not special characters.	
<b>&lt;send size&gt;:</b>	data packet size: This parameter specifies the size of the data packet that needs to be sent to the peer. This parameter is supported only for UDP continuous transparent mode.  range: 8-1460 (default value: 1020)	
<b>&lt;wait time&gt;:</b>	timeout for configuring the packet segmentation on IP network side: This parameter specifies the timeout after which the buffered data will be sent to the peer irrespective of size of the data packet. This parameter is supported only for UDP continuous transparent mode.  range: 1-100 (default value: 2)	

<sup>1</sup>: See the [DATA Offline session +WIPDATARW](#) section for more information.

## 6.2.8. Parameter Storage

None

## 6.2.9. Possible Errors

"+CMEE" AT error code	Description
831	bad state
836	memory allocation error
837	bad protocol
843	connection reset by peer

## 6.2.10. Examples

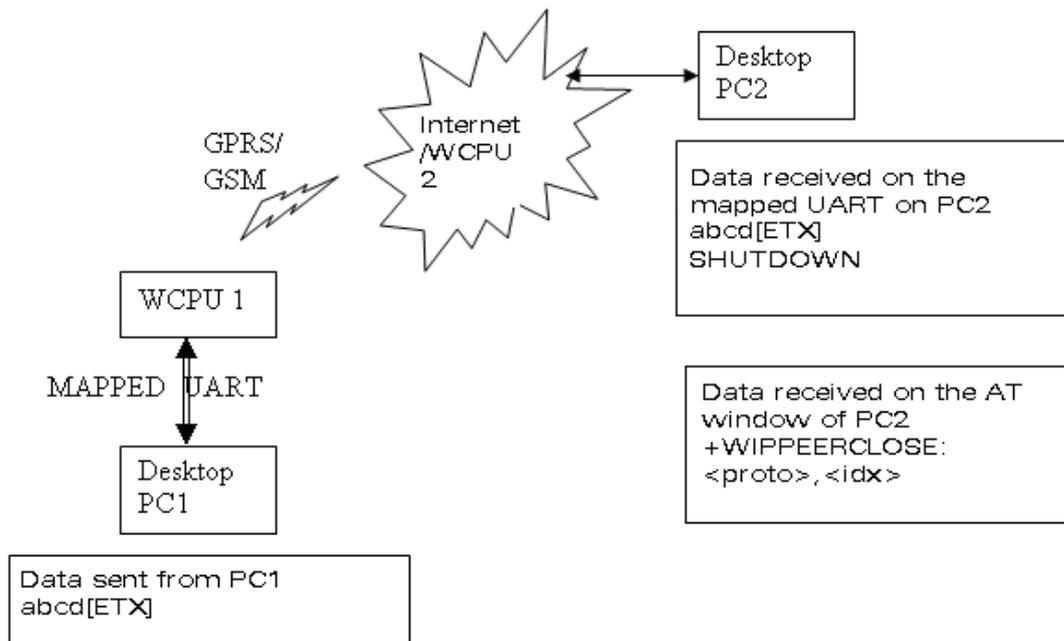

Command	Responses
<b>AT+WIPDATA=2,5,1</b>	CONNECT <read/write data> +++ OK
<i>Note; TCP Client with index 5 can send/read data in continuous mode</i>	<i>Note; +++ sequence causes the UART to switch to AT mode</i>
<b>AT+WIPDATA=2,5,1,10,5</b>	CONNECT <read/write data> +++ OK
<i>Note; TCP Client with index 5 can send/read data in continuous mode</i>	<i>Note; +++ sequence causes the UART to switch to AT mode</i>
<b>AT+WIPDATA=1,5,1</b>	CONNECT <read/write data> +++ OK
<i>Note; UDP with index 5 can send/read data in continuous mode</i>	<i>Note; +++ sequence causes the UART to switch to AT mode</i>
<b>AT+WIPDATA=1,5,1</b>	CONNECT <read/write data> <ETX> OK
<i>Note; UDP with index 5 can send/read data in continuous mode</i>	<i>Note; [ETX] character indicates end of data</i>
<b>AT+WIPDATA=1,5,2</b>	CONNECT <read/write data> +++ OK
<i>Note; UDP with index 5 can send/read data in continuous transparent mode with default value set for &lt;send size&gt; and &lt;wait time&gt;</i>	<i>Note; +++ sequence causes the UART to switch to AT mode</i>
<b>AT+WIPDATA=1,5,2,20,2</b>	CONNECT <read/write data> +++ OK
<i>Note; UDP with index 5 can send/read data in continuous transparent mode with &lt;send size&gt; set to 20 and &lt;wait time&gt; set to 2</i>	<i>Note; +++ sequence causes the UART to switch to AT mode</i>
<b>AT+WIPDATA=2,5,1,20,10</b>	CONNECT <read/write data> +++ OK

Command	Responses
<i>Note: TCP with index 5 can send/read data in continuous mode with &lt;send size&gt; set to 20 and &lt;wait time&gt; set to 10</i>	<i>Note: +++ sequence causes the UART to switch to AT mode</i>
<b>AT+WIPDATA=2,5,2,10,5</b>	CONNECT <read/write data> +++ OK
<i>Note: TCP with index 5 can send/read data in continuous transparent mode with &lt;send size&gt; set to 10 and &lt;wait time&gt; set to 5</i>	<i>Note: +++ sequence causes the UART to switch to AT mode</i>
<b>AT+WIPDATA=2,5,2</b>	CONNECT <read/write data> +++ OK
<i>Note: TCP with index 5 can send/read data in continuous transparent mode</i>	<i>Note: +++ sequence causes the UART to switch to AT mode</i>

## 6.2.11. Notes

### 6.2.11.1. Continuous Mode (Non Transparent) for a TCP Mapped Socket

If the [ETX] character is sent from the peer, it is considered as an end of data transfer. After sending an [ETX] character, the socket will be shutdown and the peer will be informed of this shutdown by a “[CR][LF]SHUTDOWN[CR][LF]” indication on its mapped UART and the UART does not switch to AT mode. This indicates that no more data can be sent from the host socket, but it can receive data. The below schematic shows the shutdown procedure for a TCP socket:

In the above schematic, a TCP socket is connected. On the transmitting side, data and [ETX] is sent (use case: Desktop PC1 is an embedded module which sends data to PC2 which is either a PC or an embedded module), the data is received on PC2 and [ETX] character shuts down the socket on the transmitting side and displays a message “[CR][LF]SHUTDOWN[CR][LF]” on the mapped UART of PC2.

When PC2 is switched back to AT mode, “+WIPPEERCLOSE: <protocol>,<idx>” indication is received indicating that no more data can be sent by PC1 but can read data sent from PC2.

There are different indications received for shutdown and reset for a TCP socket. When a TCP socket is reset, [ETX] character is sent on the mapped UART to indicate the end of communication. The mapped UART switches to AT mode and “+CME ERROR: 843” is displayed on the UART. The reset and shutdown can therefore be distinguished by the indications received on the UART.

### 6.2.11.2. Mapping/Unmapping of a Mapped UDP and TCP Socket

When a TCP socket is unmapped and still active, it is possible to map it again in another mode which is different from the previous one without closing the TCP socket.

The UART switches back to AT mode due to “+++” with 1 second guard time before and after the sequence or by sending an AT+WIPDATA=<proto>,<index>,0 on another UART in AT mode. This applies to both UDP and TCP protocols.

When +++ is issued, the embedded module switches from DATA mode to AT mode. If ATO command is used to switch the embedded module back to DATA mode,

- +CME ERROR:3 will be received when GPRS bearer is used
- no response is received when GSM bearer is used

To switch the embedded module back to DATA mode, AT+WIPDATA=x,x,x should be used instead of ATO. After executing AT+WIPDATA=x,x,x command, “CONNECT” will be received to indicate that the embedded module is switched back to DATA mode.

Note that un-mapping socket using +WIPDATA command with <send size> and <wait time> specified results in “ERROR”.

### 6.2.11.3. Time out Mechanism to know the state of the Peer TCP Socket

In a TCP server-client connection between two remote devices if the peer socket is closed down abruptly (e.g. powered off) the peer TCP socket does not get any indication message. This is a normal behavior. The TCP protocol uses a timeout mechanism to check the state of the TCP sockets in a TCP socket connection. According to this mechanism, to know the state of the peer TCP socket the data needs to be sent and wait for the acknowledgement within a specified time period. If the acknowledgement is not received within the specified time out period then the data is retransmitted. But if the time out occurs before receiving acknowledgement then it implies that the peer TCP socket is closed.

TCP Timeout Period = function (R, N)

Where,

R = Round trip time. This is the time for a TCP packet to go to the remote TCP socket and the time to receive the acknowledgement by the transmitter TCP socket. The typical round trip time is 1 seconds for GPRS.

N = Number of retransmission allowed before the time out happens.

Hence, the typical timeout period is 10 minutes depending on the network and also the peer TCP socket localization.

In WIPsoft, to know the state of the peer socket, data needs to be sent. If acknowledgement is not received within the timeout period then "+CME ERROR: 842" is returned. This indicates that the peer socket is closed.

Please note that the retransmission of the data to the peer TCP socket within the timeout period is managed by the WIPlib Plug-In.

### 6.2.11.4. Packet Segmentation in TCP Socket

The parameters used for packet segmentation can be configured using +WIPDATA or +WIPCFG command. In case if it is not configured using +WIPDATA command, then the values already set for option WIP\_NET\_OPT\_TCP\_MIN\_MSS and AT\_WIP\_NET\_OPT\_PREF\_TIMEOUT\_VALUE will be used.

Note that if an attempt is made to set data packet size more than twice the value of WIP\_NET\_OPT\_TCP\_MIN\_MSS using +WIPDATA command results in "+CME ERROR: 847".

The data sent to a mapped TCP socket through UART will be buffered before sending it to the peer. This buffered data will be sent to the peer when:

- total amount of buffered data is twice or more than the preferred segmentation size. The preferred segmentation size is configurable through the "AT+WIPCFG = 2, 4, <size>" (WIP\_NET\_OPT\_TCP\_MIN\_MSS) or +WIPDATA command.
- internal timer expires. The timeout period is configurable through the "AT+WIPCFG = 2,12,<time>" (AT\_WIP\_NET\_OPT\_PREF\_TIMEOUT\_VALUE) or +WIPDATA command.
- socket is unmapped, shut down or closed

In some scenarios, there might be a segmentation of data packets because of timer expiration, network problems etc. Thus a single packet of data may be received in more than one packet at the peer

### 6.2.11.5. Packet Segmentation in UDP Socket

This feature for UDP is supported only in case of continuous transparent mode. If the +WIPDATA command is executed in continuous mode to use this feature, "ERROR" will be returned. The parameters used for packet segmentation can be configured using +WIPDATA command. In case if it is not configured using +WIPDATA command, default value of these parameters will be used.

The data sent to a mapped UDP socket through UART will be buffered before sending it to the peer. This buffered data will be sent to the peer when:

- the buffered data size is equal to segmentation size. Note that if the buffered data is greater than segmentation size, then the data will be written to the channel in chunks of segmentation size.
- the timer expires
- socket is unmapped or closed

In some scenarios, there might be a segmentation of data packets because of timer expiration, network problems etc. Thus a single packet of data may be received in more than one packet at the peer.

## 6.3. DATA Offline session +WIPDATARW

This command is used to upload or download data on UART without switching to DATA mode (CONNECT/OK Online mode) for +WIPDATA and +WIPFILE commands.

DATA offline session starts when AT+WIPDATA command is used with mode (3) or when AT+WIPFILE command is used with mode (6, 7, 8 or 9). Otherwise +WIPDATARW command can't be use and returns +CME ERROR 831 error message.

In this mode,[DLE]/[ETX] characters are considered as normal data and not special characters. Data read or written are in hexadecimal dump format.

### 6.3.1. Restrictions

- DATA offline feature is not recommended to send or received quickly high data volume. In this case, the nominal online mode shall be used.
- To improve AT command exchange and behavior, the use of USB com port is recommended. Otherwise, UART com port buffer threshold shall be decrease with +WHCNF command (see General AT Command User Guide).
- Be careful for TCP socket (+WIPDATA), a maximum of 5840 bytes can be send. Over this size data are lost but no error is returned.
- +WIDATARW command should not be used to fill TX sender buffer with more than 5840 bytes (4\*1460) for TCP socket.

### 6.3.2. Syntax

*Action abort : <command>= 0*

**AT+WIPDATARW=<command>,<idx>**

+WIPDATARW: <state>,<idx>

OK

*Action write : <command>= 1, 2 or 3*

**AT+WIPDATARW=<command>,<idx>,"<DATA DUMP>"**

OK

*Unsolicited message <state> = 0 or 1*

+WIPDATARW: <state>,<idx>

*Unsolicited message <state> = 3*

+WIPDATARW: <state>,<idx>,<size>

```

Unsolicited message <state> = 2
+WIPDATARW: <state>,<idx>,<nb_block>,<num_block>,"<DATA DUMP>"
+WIPDATARW: <state>,<idx>,<nb_block>,<num_block>,"<DATA DUMP>"
    
```

```

Read Command
AT+WIPDATARW?
OK
    
```

```

Test Command
AT+WIPDATARW=?
OK
    
```

### 6.3.3. Parameters and Defined Values

<b>&lt;command&gt;:</b>	
0	Close WIPDATARW session.
1	WRITE and Send: Add DATA in TX buffer then send all data stored in the buffer.
2	WRITE EXT : Add DATA in TX buffer (but buffer is not sent)
3	WRITE, Send and close: Add DATA in TX buffer, send all data stored in the buffer, then close the current DATA offline session.  This command is only supported for +WIPDATA session.
<b>&lt;idx&gt;</b>	channel identifier
<b>&lt;state&gt;:</b>	
0	WIPDATARW session Closed for the channel <idx> specified
1	WIPDATARW session Opened for the channel <idx> specified.  Ready to send or received data
2	Data reading
3	Data sent
<b>&lt;DATA DUMP&gt;</b>	DATA in hexadecimal format.

To send more than 200 bytes data, use +WIPDATARW with <command> = 2 to add data to buffer and use for the last block

Data must be written in TX buffer with <command> = 2 by 200 byte block and the last block must be written with <command> =1 to write it and send the TX buffer.”

Only 200 data bytes can be read or written at a time. DATA received are displayed by 200 byte block if received data buffer to display is bigger than 200 bytes.

### 6.3.4. Parameter Storage

None

### 6.3.5. Possible Errors

<b>"+CMEE" AT error code</b>	<b>Description</b>
800	Invalid option
801	Invalid option value
830	Bad index
831	Bad state
836	Memory allocation error
853	Data offline buffer full

### 6.3.6. Examples

<b>Command</b>	<b>Responses</b>
<b>AT+WIPDATA=1,1,3</b> <i>(UDP socket have been previously created)</i>	+WIPDATARW:1,1 OK
<i>Note : exchange data on socket index 1 with AT Command</i>	<i>Note WIPDATARW session ready on channel idx 1.</i>
<b>AT+WIPDATARW=1,1,"30313233343536373839"</b>	+WIPDATARW:3,1,10 OK
<i>Note : send 10 data byte on channel idx 1</i>	<i>Note : 10 data bytes had been sent</i>
	+WIPDATA: 1,1,10,"192.168.1.2",1357 +WIPDATARW:2,1,1,1,"3132333435363738" OK
	<i>Note : Data dump received on channel idx 1</i>
<b>AT+WIPDATARW=2,1,"30 [...] 39"</b>	OK
<i>Note : Write 200 Data bytes in TX Buffer</i>	<i>Note : 200 data bytes are stored in TX Buffer</i>
<b>AT+WIPDATARW=2,1,"30 [...] 39"</b>	OK
<i>Note : Write 200 Data bytes in TX Buffer</i>	<i>Note : 200 data bytes are stored in TX Buffer</i>
<b>AT+WIPDATARW=1,1,"3039"</b>	+WIPDATARW:3,1,402 OK
<i>Note : Write 2 Data bytes in TX Buffer and send buffer.</i>	<i>Note : 402 data bytes have been sent</i>
<b>AT+WIPDATARW=0,1</b>	+WIPDATARW:0,1 OK

<i>Note : Close WIPDATARW session on channel idx 1</i>	
<b>AT+WIPDATARW=1,1,"30313233343536373839"</b>	+CME ERROR: 831
<i>Note : try to send 10 bytes on channel index 1</i>	<i>Note : WIPDATARW session is not open in channel idx 1</i>
<b>AT+WIPFILE=4,2,6,"./filename.txt"</b>	+WIPDATARW:1,2 OK
<i>Note : Start data offline session for uploading file "filename.txt"</i>	
<b>AT+WIPDATARW=1,2,"30313233343536373839"</b>	+WIPDATARW:4,2,10 +WIPDATARW:0,2 OK
<i>Note : Upload data</i>	<i>Note : 10 bytes uploaded WIPDATARW session closed on channel idx 2</i>
<b>AT+WIPFILE=4,2,7,"./filename.txt"</b>	+WIPDATARW:3,2,2,1,"31 [...]" +WIPDATARW:3,2,2,2,"31 [...]" +WIPDATARW:0,2 OK
<i>Note : Download and display "filename.txt" file</i>	<i>Note : More than 200 data downloaded WIPDATARW session closed on channel idx 2</i>

## 7. Ping Services

### 7.1. PING command +WIPPING

#### 7.1.1. Description

The +WIPPING command is used to configure different PING parameters and to send PING requests. An unsolicited response is displayed each time a “PING” echo event is received or a timeout expires.

#### 7.1.2. Syntax

##### *Action Command*

```
AT+WIPPING=<host>, [<repeat>,<interval>, [<timeout>, [<nwrite>, [<ttl>]]]]
```

OK

##### *Read Command*

```
AT+WIPPING?
```

OK

##### *Test Command*

```
AT+WIPPING=?
```

OK

##### *Unsolicited response*

```
+WIPPING:<timeout_expired>,<packet_idx>,<response_time>
```

### 7.1.3. Parameters and Defined Values

<b>&lt;host&gt;:</b>	host name or IP address string
<b>&lt;repeat&gt;:</b>	number of packets to send range: 1-65535 (default value:1)
<b>&lt;interval&gt;:</b>	number of milliseconds between packets range: 1-65535 (default value:2000)
<b>&lt;timeout&gt;:</b>	number of milliseconds before a packet is considered lost range: 1-65535 (default value:2000)
<b>&lt;tll&gt;:</b>	IP packet Time To Live. Default value is set by WIP_NET_OPT_IP_TTL +WIPCFG option range : 0-255
<b>&lt;nwrite&gt;:</b>	size of packets range : 1-1500 (default value:64)
<b>&lt;timeout_expired&gt;:</b>	PING result 0: PING response received before <timeout> 1: <timeout> expired before the response was received
<b>&lt;packet_idx&gt;:</b>	packet index in the sequence
<b>&lt;response_time&gt;:</b>	PING response time in millisecond

### 7.1.4. Parameter Storage

None

### 7.1.5. Possible Errors

<b>“+CMEE” AT error code</b>	<b>Description</b>
800	invalid option
801	invalid option value
819	error on ping channel

## 7.1.6. Examples

Command	Responses
<b>AT+WIPPING="www.sierrawireless.com"</b>	OK +WIPPING: 1,0,0
<i>Note: Ping "www.sierrawireless.com"</i>	<i>Note: Ping "www.sierrawireless.com failed : timeout expired"</i>
<b>AT+WIPPING="192.168.0.1"</b>	OK +WIPPING: 0,0,224
<i>Note: Ping "192.168.0.1"</i>	<i>Note: Ping "192.168.0.1 succeeded. Ping response received in 224 ms"</i>
<b>AT+WIPPING="192.168.0.1",2,2000,1000</b>	OK +WIPPING: 0,0,880 +WIPPING: 1,1,xxxx
<i>Note: Send 2 successive ping requests to "192.168.0.1". Each Ping is every 2000 ms, timeout is set to 1000 ms (if ping responses time is more than 1000 ms then timeout expires)</i>	<i>Note: Ping "192.168.0.1 succeeded. First Ping response received in 880 ms. Second one was not received before specified timeout (1000 ms) ⇔ timeout expired"</i>

## 8. WIPsoft Library API

The WIPsoft Application provides a comprehensive and flexible environment to use the IP feature using AT commands. The WIPsoft Application is an application and it uses the WIPlib Plug-In as the TCP/IP protocol stack. Hence when the WIPsoft application executed no other application can be executed in the embedded module. WIPsoft API allow customer application to subscribe for AT+WIP commands

Customer application can subscribe to AT+WIP commands using WIPsoft library API. This feature allows customer application to use ADL services with WIPsoft services. Note that concurrent access to IP stack from WIPsoft library and WIP library results in unpredictable events and behavior. Hence it is recommended to us either WIPsoft library API or WIP library at a time but not both at the same time.

The FCM flow, through which the WIP AT commands are executed, is subscribed by the WIPsoft library to transfer data between the embedded module and the external device. Hence, if the WIPsoft library is subscribed from the application, same FCM flow should not be subscribed from the same application.

### 8.1. Required Header File

The header file for the WIP AT command interface is wip\_atcmd.h.

### 8.2. The wip\_ATCmdSubscribe Function

The wip\_ATCmdSubscribe function subscribes to +WIPCFG, +WIPBR, +WIPPING, +WIPCREATE, +WIPDATA, +WIPFILE, +WIPOPT AT commands provided by WIPsoft.

#### 8.2.1. Prototype

```
s32 wip_ATCmdSubscribe ( void );
```

#### 8.2.2. Parameters

None

#### 8.2.3. Returned Values

The function returns

- 0 on success
- negative error code on failure as described below:

Error Code	Description
-1	subscription for WIP AT commands fails
-2	WIP AT commands already subscribed

## 8.3. The wip\_ATCmdUnsubscribe Function

The wip\_ATCmdUnsubscribe function unsubscribes to +WIPCFG, +WIPBR, +WIPPING, +WIPCREATE, +WIPDATA, +WIPFILE, +WIPOPT AT commands provided by WIPsoft.

### 8.3.1. Prototype

```
s32 wip_ATCmdUnsubscribe ( void );
```

### 8.3.2. Parameters

None

### 8.3.3. Returned Values

The function returns

- 0 on success
- negative error code on failure as described below:

Error Code	Description
-3	WIP AT commands already unsubscribed
-4	un-subscription for WIP AT commands fails

## >> 9. Examples of Application

### 9.1. TCP Socket

#### 9.1.1. TCP Server Socket

##### 9.1.1.1. Using GPRS bearer

```
AT+WIPCFG=1 //start IP stack
OK
AT+WIPBR=1,6 //open GPRS bearer
OK
AT+WIPBR=2,6,11,"APN name" //set APN name of GPRS bearer
OK
AT+WIPBR=2,6,0,"user name" //set user name (<login>)
OK
AT+WIPBR=2,6,1,"passwd" //set password (<password>)
OK
AT+WIPBR=4,6,0 //start GPRS bearer
OK
AT+WIPCREATE=3,1,80,5,8 //create the server on port 80, idx = 1. The server
//is listening for connection request on port
//80. Spawned sockets will be given the index 5,
//6, 7 and 8. It will accept connection request
//until it has no more socket left.
+WIPACCEPT: 1,5 //unsolicited: the server accepted a connection
//resulting TCP client on idx 5.
AT+WIPDATA=2,5,1 //exchange data on socket index 5
CONNECT
... //read, write
+++ //switch to AT mode
OK
AT+WIPCLOSE=2,5 //close the TCP client socket index 5
OK
```

### 9.1.1.2. Using GSM bearer

```

AT+WIPCFG=1 //start IP stack
OK
AT+WIPBR=1,5 //open GSM bearer
OK
AT+WIPBR=2,5,2,"Phone number" //set phone number for GSM bearer
OK
AT+WIPBR=2,5,0,"user name" //set user name
OK
AT+WIPBR=2,5,1,"passwd" //set password
OK
AT+WIPBR=4,5,0 //start GSM bearer
OK
AT+WIPCREATE=3,1,80,5,8 //create the server on port 80, idx = 1. The server
//is listening for connection request on port
//80.Spawned sockets will be given the index 5,
//6, 7 and 8. It will accept connection request
//until it has no more socket left.
+WIPACCEPT: 1,5 //unsolicited: the server accepted a connection
//resulting TCP client on idx 5
AT+WIPDATA=2,5,1 //exchange data on socket idx 5
CONNECT
... //read, write
+++ //switch to AT mode
OK
AT+WIPCLOSE=2,5 //close the TCP client socket index 5
OK

```

## 9.1.2. TCP Client Socket

### 9.1.2.1. Using GPRS Bearer

```

AT+WIPCFG=1 //start IP stack
OK
AT+WIPBR=1,6 //open GPRS bearer
OK
AT+WIPBR=2,6,11,"APN name" //set APN name of GPRS bearer
OK
AT+WIPBR=2,6,0,"user name" //set user name
OK
AT+WIPBR=2,6,1,"passwd" //set password
OK
AT+WIPBR=4,6,0 //start GPRS bearer
OK
AT+WIPCREATE=2,1,"ip addr",80 //create a TCP client towards peer IP device @ "ip
//addr", port 80.
OK //all parameters and IP stack behavior are OK.
+WIPREADY: 2,1 //unsolicited: the TCP client socket is connected
//to the peer
AT+WIPDATA=2,1,1 //exchange data on socket idx 1:
CONNECT
... //read, write
+++ //switch to AT mode
OK
AT+WIPCLOSE=2,1 //close the TCP client socket index 1
OK

```

### 9.1.2.2. Using GSM Bearer

```

AT+WIPCFG=1 //start IP stack
OK
AT+WIPBR=1,5 //open GSM bearer
OK
AT+WIPBR=2,5,2,"Phone number" //set phone number for GSM bearer
OK
AT+WIPBR=2,5,0,"user name" //set user name
OK
AT+WIPBR=2,5,1,"passwd" //set password
OK
AT+WIPBR=4,5,0 //start GSM bearer
OK
AT+WIPCREATE=2,1,"ip addr",80 //create a TCP client towards peer IP device @ "ip
//addr", port 80
OK //all parameters and IP stack behavior are OK
+WIPREADY: 2,1 //unsolicited: the TCP client socket is connected to
//the peer
AT+WIPDATA=2,1,1 //exchange data on socket idx 1
CONNECT
... //read, write
+++ //switch to AT mode
OK
AT+WIPCLOSE=2,1 //close the TCP client socket index 1
OK

```

## 9.2. UDP Socket

```

AT+WIPCFG=1 //start IP stack
OK
AT+WIPBR=1,6 //open GPRS bearer
OK
AT+WIPBR=2,6,11,"APN name" //set APN name of GPRS bearer
OK
AT+WIPBR=2,6,0,"user name" //set user name
OK
AT+WIPBR=2,6,1,"passwd" //set password
OK
AT+WIPBR=4,6,0 //start GPRS bearer
OK
AT+WIPCREATE=1,1,80,"www.sierrawireless.com",80 //create a UDP client towards peer IP device @
//"www.sierrawireless.com", port 80
OK //all parameters and IP stack behavior are OK

+WIPREADY: 1,1 //unsolicited: the UDP client socket is "pseudo"
//connected to the peer (no //real connection is
UDP)

AT+WIPDATA=1,1,1 //exchange data on socket idx 1:
CONNECT
... //read, write
+++ //switch to AT mode
OK
AT+WIPCLOSE=1,1 //close the UDP socket index 1
OK
AT+WIPCREATE=1,1,1234 //start a UDP server and listen for datagram on port
//1234
OK //all parameters and IP stack //behavior are OK

+WIPREADY: 1,1 //unsolicited: the UDP client socket is "pseudo"
//connected to the peer (no real connection is UDP)

+WIPDATA: //one datagram is ready to be read : it was sent
1,1,25,"192.168.0.2",2397 from //192.168.0.2 on port //2397 and is composed
of 25 //bytes
AT+WIPDATA=1,1,1

```

```
CONNECT
abcdedghijklmnopqrstuvwxyz [ETX] //here 25 bytes + the [ETX] character (marking the
//bound of the datagram) have been read.

+++ or AT+WIPDATA=1,1,0 //type on this UART "+++" escape sequence or un
//map the UART on other control port (USB UART)

OK //here UART is back to AT command mode. If some
//other remote IP devices sent some one or more
//datagrams while reading for the first one, then a
//new datagram indication is received

+WIPDATA: //one datagram is ready to be read : it was sent
1,1,50,"192.168.0.4",58 from //192.168.0.4 on port 58 and is composed of
50 //bytes

AT+WIPDATA=1,1,1

CONNECT
abcdedghijklmnopqrstuvwxyzabcd //here 25 bytes + the [ETX] character (marking the
ghijklmnopqrstuvwxyz [ETX] //bound of the datagram) have been read.
```

## 9.3. PING

```
AT+WIPCFG=1 //start IP stack
OK
AT+WIPBR=1,6 //open GPRS bearer
OK
AT+WIPBR=2,6,11,"APN name" //set APN name of GPRS bearer
OK
AT+WIPBR=2,6,0,"user name" //set user name
OK
AT+WIPBR=2,6,1,"passwd" //set password
OK
AT+WIPBR=4,6,0 //start GPRS bearer
OK
AT+WIPPING="192.168.0.1" //start PING session
OK
+WIPPING:0,0,224
```

## 9.4. FTP

```
AT+WIPCFG=1 //start IP stack
OK
AT+WIPBR=1,6 //open GPRS bearer
OK
AT+WIPBR=2,6,11,"APN name" //set APN name of GPRS bearer
OK
AT+WIPBR=2,6,0,"user name" //set user name
OK
AT+WIPBR=2,6,1,"passwd" //set password
OK
AT+WIPBR=4,6,0 //start GPRS bearer
OK
AT+WIPCREATE=4,1,"FTP //create FTP session
server",21,"username","passwd"
OK
AT+WIPFILE=4,1,2,"./filename.txt" //upload file "filename.txt"
CONNECT
<data>
[ETX]
OK

                               users has sent the last file. This is to avoid
                               deadlock errors where the user missed to send
                               a file.
OK //the server accepted a connection and the
    MMS was sent successfully
+WIPPEERCLOSE: 8,1 //unsolicited: the MMS session is closed.

```

## 9.10. Creating a TCP Server, spawning the maximum TCP Socket (for the configured Server)

```

AT+WIPCFG=1 //start IP stack
OK
AT+WIPBR=1,6 //open GPRS bearer
OK
AT+WIPBR=2,6,11,"APN name" //set APN name of GPRS bearer
OK
AT+WIPBR=2,6,0,"user name" //set user name
OK
AT+WIPBR=2,6,1,"passwd" //set password
OK
AT+WIPBR=4,6,0 //start GPRS bearer
OK
AT+WIPCREATE=3,1,80,5,6 //create the server on port 80, idx = 1. The
//server is listening for connection request on
//port 80.Spawned sockets will be given the
//index 5 or 6. It will accept connection request
//until it has no more socket left.
+WIPACCEPT: 1,5 //unsolicited: the server accepted a connection
//resulting TCP client on idx 5.
+WIPACCEPT: 1,6 //unsolicited: the server accepted a connection
//resulting TCP client on idx 6.
AT+WIPCLOSE=2,5 //close the spawned TCP client socket index 5.
OK //now if the peer device try to connect to the
//server it shall receive an accept () immediately
//followed by an shutdown() (connection reset
//by peer)

```

## 9.11. Creating a Server and try to create a TCP Client/Server on a reserved index (reserved by the Server) will fail.

```

AT+WIPCFG=1 //start IP stack
OK
AT+WIPBR=1,6 //open GPRS bearer
OK
AT+WIPBR=2,6,11,"APN name" //set APN name of GPRS bearer
OK
AT+WIPBR=2,6,0,"user name" //set user name
OK
AT+WIPBR=2,6,1,"passwd" //set password
OK
AT+WIPBR=4,6,0 //start GPRS bearer
OK
AT+WIPCREATE=3,2,80,1,2 //create the server on port 80, idx=2. The server
//is listening for connection request on port 80.
//Spawned sockets will be given the index 1 or
//2.It will accept connection request until has
//nor more socket left.
OK
AT+WIPCREATE=2,3,"198.168.0.1",80 //create a TCP client towards peer IP device @
//"198.168.0.1", port 80,
OK //all parameters and IP stack behavior are OK.
+WIPREADY: 2,3 //unsolicited: the TCP client socket is connected
//to the peer.

## 9.16. Subscribe/Unsubscribe WIPsoft AT commands using WIPsoft Library API

```
#include "adl_global.h"    // Global includes
#include "wip_atcmd.h"    // WIP AT command services
#if __OAT_API_VERSION__ >= 400
const u16 wm_apmCustomStackSize = 4096;
#else
u32 wm_apmCustomStack[1024];
const u16 wm_apmCustomStackSize = sizeof(wm_apmCustomStack);
#endif

void adl_main ( adl_InitType_e InitType )
{
    TRACE (( 1, "Embedded Application : Main" ));
    /* subscribe to the +WIP AT commands set service */
    if ( wip_ATCmdSubscribe() == 0) {
        /* The customer can write here its own application based on other
           plug -ins or its specific application target. */
        wip_ATCmdUnsubscribe();
    }
    else
    {
        /* Error while subscribing to WIPsoft library */
    }
}
```

## 9.17. Creating TCP client and server sockets in the same Wireless CPU at the same time mapping or unmapping the UART to exchange the data between the sockets

```

AT+WIPCFG=1 //start IP stack
OK
AT+WIPBR=1,6 //open GPRS bearer
OK
AT+WIPBR=2,6,11,"APN name" //set APN name of GPRS bearer
OK
AT+WIPBR=2,6,0,"user name" //set user name
OK
AT+WIPBR=2,6,1,"passwd" //set password
OK
AT+WIPBR=4,6,0 //start GPRS bearer
OK
AT+WIPCREATE=3,2,80,1,2 //create the server on port 80, idx=2. The server
//is listening for connection request on port 80.
//Spawned sockets will be given the index 1 or
//2.It will accept connection request until has
//nor more socket left.
OK
AT+WIPCREATE=2,3,"198.168.0.1",80 //create a TCP client towards peer IP device @
//"198.168.0.1", port 80,
OK //all parameters and IP stack behavior are OK.
+WIPREADY: 2,3 //unsolicited: the TCP client socket is connected
//to the peer.
+WIPACCEPT: 2,1 //unsolicited: the server index accepted a
//connection; resulting TCP client on idx 1
AT+WIPDATA=2,3,1 //exchange data on socket index 3
CONNECT
abc+++ //data sent to socket index 1 and switched to
AT mode by giving +++
OK
AT+WIPDATA=2,1,1 //exchange data on socket index 1
CONNECT
abc+++ //data received from socket index 3
OK

```

# >> 10. Error Codes

## 10.1. General CME Error Codes

<b>“+CMEE” AT error code</b>	<b>Description</b>
800	invalid option
801	invalid option value
802	not enough memory
803	operation not allowed in the current WIP stack state
804	device already open
805	network interface not available
806	operation not allowed on the considered bearer
807	bearer connection failure : line busy
808	bearer connection failure : no answer
809	bearer connection failure : no carrier
810	bearer connection failure : no sim card present
811	bearer connection failure : sim not ready (no pin code entered, ...)
812	bearer connection failure : GPRS network failure
813	bearer connection failure : PPP LCP negotiation failed
814	bearer connection failure : PPP authentication failed
815	bearer connection failure : PPP IPCP negotiation failed
816	bearer connection failure : PPP peer terminates session
817	bearer connection failure : PPP peer does not answer to echo request
818	incoming call refused
819	error on Ping channel
820	error writing configuration in FLASH memory
821	error reading configuration in FLASH memory
822-829	reserved for future use
830	bad index
831	bad state
832	bad port number
833	bad port state
834	not implemented
835	option not supported
836	memory allocation error
837	bad protocol
838	no more free socket
839	error during channel creation
840	UDP/TCP socket or FTP/HTTP/SMTP/POP3 session is already active
841	peer closed, or error in the FTP connection
842	destination host unreachable ( whether host unreachable, Network unreachable, response timeout)

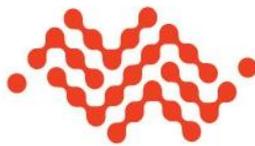

“+CMEE” AT error code	Description
843	connection reset by peer
844	stack already started
845	attempt is made to reserve/create a client socket which is already reserved/opened by TCP server/client
846	internal error: FCM subscription failure
847	bearer connection failure: WIP_BOPT_GPRS_TIMEOUT time limit expired before GPRS bearer connected
848	impossible to connect to the bearer
849	connection to the bearer has succeeded but a problem has occurred during the data flow establishment
850	invalid channel option or parameter value (for example, HTTP user name too long)
851	specified parameters to the command is more or less than the maximum number of mandatory parameters
852	IP stack not initialized
853	Data offline buffer filled
854-859	reserved for future use
860	protocol undefined or internal error
861	username rejected by server
862	password rejected by server
863	delete error
864	list error
865	authentication error
866	server not ready error
867	POP3 email retrieving error
868	POP3 email size error
869-879	reserved for future use
880	SMTP sender email address rejected by server
881	SMTP recipient email address rejected by server
882	SMTP CC recipient email address rejected by server
883	SMTP BCC recipient email address rejected by server
884	SMTP email body send request rejected by server
890	Service denied
891	Message format corrupt
892	Address unresolved
893	Message not found
894	Network problem
895	Content not accepted
896	Unsupported message
897	Unspecified error

## 10.2. GPRS CME Error Codes

<b>&lt;error&gt;</b>	<b>Meaning</b>	<b>Resulting from the following commands</b>
103	Incorrect MS identity.(#3)	+CGATT
132	Service option not supported (#32)	+CGACT +CGDATA ATD*99
133	Requested service option not subscribed (#33)	+CGACT +CGDATA ATD*99
134	Service option temporarily out of order (#26, #34, #38)	+CGACT +CGDATA ATD*99
148	Unspecified GPRS error	All GPRS commands
149	PDP authentication failure (#29)	+CGACT +CGDATA ATD*99
150	Invalid mobile class	+CGCLASS +CGATT
